Abstract—This paper presents the results of empirical research conducted during March to September 2009. The study focused on the influence of virtual research and development (R&D) teams within Malaysian manufacturing small and medium sized enterprises (SMEs). The specific objective of the study is better understanding of the application of collaborative technologies in business, to find the effective factors to assist SMEs to remain competitive in the future. The paper stresses to find an answer for a question “Is there any relationship between company size, Internet connection facility and virtuality?”. The survey data shows SMEs are now technologically capable of performing the virtual collaborative team, but the infrastructure usage is less. SMEs now have the necessary technology to begin the implementation process of collaborative tools to reduce research and development (R&D) time, costs and increase productivity. So, the manager of R&D should take the potentials of virtual teams into account.

Keywords—Small and medium enterprises, Collaborative tools, Questionnaires, Virtual teams.

I. INTRODUCTION

Collaboration in research and development (R&D) is becoming increasingly important in creating the knowledge that makes research and business more competitive [1]. The internet, incorporating computers and multimedia, has provided tremendous potential for remote integration and collaboration in business and manufacturing applications [2]. Web service technology also provides a unique way to application-to-application interaction over the Internet [3]. Currently, many R&D organizations and teams use a specialized knowledge portal for research collaboration and knowledge management [4]. A web-based virtual collaborative team is enabling authorized users in geographically different locations to have access to the company’s product data such as product drawing files stored at designated servers and carry out product design work simultaneously and collaboratively on any operating systems [5]. Despite computers’ widespread use for personal applications, very few SMEs use this new phenomenon [6].

On the other hand, small and medium-sized enterprises (SMEs) which are a major part of the industrial economies [7] needs to reduce R&D time and costs in order to compete in the competitive market. Gassmann and Keupp [8] found that managers of SMEs should invest less in tangible assets, but more in those areas that will directly create their future competitive advantage (e.g., in R&D to generate knowledge, and in their employees’ creativity to stimulate incremental innovations in existing technologies). One very important trend to enable new knowledge creation and transfer in and to SME’s is developing virtual collaborative environments and networks to increase their innovation abilities as a single unit but also the capabilities of the network as a whole [9].

Virtuality has been presented as one solution for SMEs aiming to increase their competitiveness [10, 11]. Virtual teams reduce time-to-market [12, 13]. Lead Time or Time to market has been generally admitted to being one of the most important keys for success in manufacturing companies [14].

In line with moving trend to virtual collaborative teams in SMEs, this paper based on the survey results explore the relationship between the number of SMEs employee and the Net connection facility with virtuality. While, virtuality brings couples of advantages to SMEs, the question is raised “Why SMEs do not use virtual collaborative teams?”. Based on literature and survey finding future study and suggestions are advanced.

II. SMEs DEFINITION AND IMPORTANCE

There are many accepted definitions of SMEs, and the classifications vary from industry to industry and from country to the country [15]. Different countries adopt different criteria such as employment, sales or investment for defining small and medium enterprises [16]. The case studies employed the definition of Malaysian manufacturer sector SMEs according to Table I.

Economists believe that the wealth of nations and the growth of their economies strongly depend upon their SMEs’ performance [17]. In many developed and developing countries, SMEs are the unsung heroes that bring stability to the national economy. They help buffer the shocks that come with the boom and bust of economic cycles [18, 19]. SMEs

also serve as the key engine behind equalizing income disparity among workers [20].

III. R&D DISTRIBUTED TEAM AND SMEs

SMEs need appropriate and up-to-date knowledge in order to compete and there is a strong need to create, share and disseminate knowledge within SME’s [21]. Especially, in the emerging and dynamic markets the shared knowledge creation and innovation may speed up market development [22]. The key elements in knowledge sharing are not only the hardware and software, but also the ability and willingness of team members to actively participate in the knowledge sharing processes [23]. Dickson and Hadjimanolis [24] examined innovation and networking among small manufacturing companies. They found some tentative evidence that companies operating in terms of “the local strategic network” are more innovative than those operating in terms of “the local self-sufficiency”. In the beginning of R&D activities SMEs always face capital shortage and need technological assistance. Most firms today do not operate alone; they are networked vertically with many value-chain partners [25]. R&D activities are now dependent to different location drivers [26]. Most SMEs are heavily reliant on external sources, including customers and suppliers, for the generation of new knowledge [27]. SMEs of all sizes must reach out into their external environment for necessary resources [28]. In the present era of globalization, it is obvious that the survival of the SMEs will be determined first and foremost by their ability to manufacture and supply more, at competitive cost, in less delivery time, with minimum defects, using fewer resources [29]. In order to face this challenge, SMEs can reinforce knowledge to create synergies that allow firms to overcome difficulties and succeed. This may lead to new relationships between different agents to overcome scarcity and/or difficulties in gaining access to resources [30]. The combination of explosive knowledge growth and inexpensive information transfer creates a fertile soil for unlimited virtual invention [25]. Web resource services can help the enterprises to get external service resources and implement collaborative design and manufacturing [31]. Sharma and Bhagwat [29] study results reveal that IT in SMEs is still in a backseat, although the use of computers is continuously increasing in their operations.

IV. METHOD & DATA COLLECTIONS

An online survey was conducted in the spring and summer of 2009 to identify the relationship between the number of employees, Internet connection and virtual teaming, among the Malaysian manufacturing SMEs. The online questionnaire was distributed through the e-mail to Malaysian manufacturing SMEs. Two thousand and sixty eight email addresses collected from Malaysian SME Business Directory [32] and questionnaires were sent to manufacturing SMEs. The online system received replies from 356 entities were received the email and clicked the link, within the desired timeframe. Participants were directed to a website, and the survey was completed on-line. The rapid expansion of Internet users has given web-based surveys the potential to become a powerful tool in survey research [33]. Denscombe [34] findings encourage social researchers to use web-based questionnaires with confidence and the data produced by web-based questionnaires is equivalent to that produced by paper-based questionnaires. Other authors stressed the data provided by Internet methods are of at least as good quality as those provided by traditional paper-and-pencil methods [35, 36]. The survey was first tested with 12 expert people, then adjusted and distributed.

Finally, a questionnaire was distributed to 356 Malaysian manufacturing SMEs. The main target group regards the organization’s size and field of industry was, managing director, R&D manager, new product development manager, project and design manager and right people who were most familiar with the R&D issue in the organizations. 74 usable questionnaires were received, representing a 20.8 percent return rate. The response rate was satisfactory since accessing the managers is usually difficult. Table II summarized online survey data collection. 42 SMEs were met the criteria of this research so the rest of responded took away from analysis. Descriptive statistics were used to analyze the responses. Table III shows the frequency of using virtual teams among the sample Malaysian SMEs.

V. SURVEY RESULTS AND DISCUSSION

From the data presented in Table III, we see that although, virtual teams’ application in manufacturing SMEs is still in infancy but virtual teaming is becoming accepted in Malaysian manufacturing SMEs. One out of three companies uses virtual teams. A cross-tabulation descriptive statistics employed to find the frequency and relationship between the virtuality, number of employees and the type of internet connections, as illustrate in Table IV. The result shows that small SMEs employed virtual collaborative teams but medium sized SMEs in the sample did not use virtual teams, although they have sufficient internet connection facilities.

### TABLE II. SUMMARIZED ONLINE SURVEY DATA COLLECTION

| Numbers of emails sent to Malaysian Firms | 2068 |
| Total Responses (Click the online web page) | 356 |
| Total Responses / Received questionnaire (%) | 17.2 |
| Total Completed | 74 |
| Total Completed / Received questionnaire (%) | 20.8 |

### TABLE III. CROSS-TABULATION BETWEEN COUNTRY AND VIRTUAL TEAM

<table>
<thead>
<tr>

<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>14</td>
</tr>
<tr>
<td>%</td>
<td>33.3%</td>
</tr>
</tbody>
</table>
Spearman’s rho correlation coefficient was employed to measure the strength and direction of the relationship among virtuality, Internet connections and number of employees. There was a significant correlation between virtuality and number of employees (0.327) and p = 0.035. The correlation coefficient between virtuality and number of employees was 0.327 and p = 0.035. The result shows that there is a significant positive relationship between virtuality and number of employees (r = 0.327). A similar result was found for the relationship between virtuality and number of employees (r = 0.327).

The research findings indicate that both SMEs with virtual teams and not, equally has access to the internet connection. The correlation coefficient between virtuality and number of employees was 0.327. Due to the lack of normality of collected data, the non-parametric statistical correlations for ordinal data were applied. The research and development requires higher levels of expertise within SMEs. Exchange knowledge and expertise can be created across virtual R&D teams. In principle, virtual teams could allow rapid decision-making to operate within SMEs, regardless of the geographical location of its members. Although the infrastructure is ready for almost all SMEs, only one third of SMEs use internet connection facilities for setting up virtual R&D teams. So, the manager of R&D should take the potentials of virtual teams into account. Data from the Malaysian manufacturing SMEs sources shows, technologically SMEs capable of performing the virtual collaborative team. Despite the enormous benefaction of employ virtual R&D teams in manufacturing SMEs, applying the virtual teams by most enterprises, is still at its infancy.

This study is probably the first to present an empirical study on virtual R&D teams, which was limited to Malaysian manufacturing SMEs. The future research needs to investigate the correlations between the number of employees, virtuality and Internet connections by a larger sample from different sectors. The theme of virtual collaborative R&D teams has not been much explored and researchers in this field are encouraging to do more studies.

VI. CONCLUSION

The research and development requires higher levels of expertise within SMEs. Exchange knowledge and expertise can be created across virtual R&D teams. In principle, virtual teams could allow rapid decision-making to operate within SMEs, regardless of the geographical location of its members. Although the infrastructure is ready for almost all SMEs, only one third of SMEs use internet connection facilities for setting up virtual R&D teams. So, the manager of R&D should take the potentials of virtual teams into account. Data from the Malaysian manufacturing SMEs sources shows, technologically SMEs capable of performing the virtual collaborative team. Despite the enormous benefaction of employ virtual R&D teams in manufacturing SMEs, applying the virtual teams by most enterprises, is still at its infancy.
