## Executive summary

---

The interest and debate on the notion of ‘consumer empowerment’ has been rapidly increasing during the last decades. M. Monti in his report to the president of the European Commission “A new strategy for the single market”<sup>1</sup> places consumers and consumer welfare at the centre of next stage of the single market (page 41). Wider choice, better information and an enhanced corpus of rights, protections and means of redress are keywords of this view of consumer empowerment. On the other hand, the literature emphasises the connections with skills, competences, and the abilities of the consumers stating that a thorough knowledge of actual capacities, information and assertiveness of consumers is crucial for being able to design and develop policies that effectively enhance consumer protection. At the European Level the 2007-2013 EU Consumer Policy Strategy, while setting as a main objective “to empower EU consumers”, also emphasizes the importance of a better understanding of how consumers actually behave, advocating for the need of having *real choices, accurate information, market transparency and the confidence that comes from effective protection and solid rights.*<sup>2</sup>

It is to answer to these political needs that DG Health & Consumers and DG ESTAT lunched in 2010 a Eurobarometer survey (Special Eurobarometer n. 342) on consumer empowerment aiming at collecting internationally comparable data on (i) consumers’ basic numerical and financial skills, (ii) consumers’ level of information on rights and prices, and (iii) consumers complaint and reporting behaviour, as well as consumers’ experience with misleading or fraudulent offers. The dataset covers 29 countries (EU27 plus Iceland and Norway) and had 56,470 respondents. The DG Health & Consumers together with the DG Joint Research Center synthesized part of these data into a unique measure of consumer empowerment, the Consumer Empowerment Index. The Index describes consumer empowerment along three main dimensions: *Consumer skills, Awareness of consumer legislation* and *Consumer engagement*, acknowledging the multifaceted concept of empowerment.

This report describes the steps followed in the construction of the Index of consumer Empowerment. In particular the definition of the theoretical framework, the quantification of categorical survey questions, the univariate and multivariate analysis of the dataset, and the set of weight used for calculating the scores and ranks of the Index. The report also discusses the robustness of the results and the relationship

<sup>2</sup> COM(2007) 99 final, page 6.

between the Index and the socio-economic characteristics of the respondents in order to identify the features of the most vulnerable consumers.

The Consumer Empowerment Index is a pilot exercise, aimed at obtaining a first snapshot of the state of consumer empowerment as measured by the Eurobarometer survey. It is neither a final answer on empowerment nor a comprehensive study on all the different facets of consumer empowerment, but instead it is meant to foster the debate on the determinants of empowerment and their importance for protecting consumers.

The Consumer Empowerment Index identifies Norway as the leading country followed by Finland, the Netherlands and Germany and Denmark. The middle of the ranking is dominated by western countries such as Belgium, France, and UK, with an average score 13% lower than the top five. At the bottom of the Index are some Eastern and Baltic countries like Bulgaria, Lithuania, Poland, and Romania with a score 31% lower on average (this gap reaches 40% and 38% in *Awareness of consumer legislation* and *Consumer skills*). A group of southern countries, Italy, Portugal, and Spain score poorly in the Index, especially in the pillar *Consumer skills* where the gap with the top performers reaches 30%.

The survey asked the respondents to express their opinion on whether, as consumers, they feel confident, knowledgeable, and protected. The comparison between these perceptions and the Consumer Empowerment Index shows that consumers who feel to be knowledgeable are also those who show higher basic skills and better capacity to read logos and labels. Consumers who feel confident seem not to read completely and carefully terms and conditions when signing contracts, while they seem to be more interested in information on their rights as compared to non empowered consumers. Detriment and redress is not significantly related to the perception of protection.

How can we construct an identikit of the most/least empowered consumers? A possibility is to study the socioeconomic characteristics of the survey respondents. Below the main conclusions.

- Gender. In all European countries but Norway male respondents score systematically better than female in all pillars and the Consumer Empowerment Index even if 31.7% of them have the lead in shopping decisions vis à vis the 68.4% of female respondents.
- Age. The age of respondents plays an inverse role in their empowerment: younger generations seem to be more skilled, aware and engaged than older generations, with the notable exception of Italy where respondents in the age cohort over-54 are 16.4% more engaged than those in the age cohort 15-24, 11% more aware of their rights and 6% more skilled.

- Occupation. Overall the non active population is less empowered than active population, in 18 out of 29 countries the least empowered are retired consumers, in 5 countries consumers not working (either unemployed or looking after the home) and in 3 countries the least empowered are unskilled manual workers. In all countries but Italy students are among the most empowered.
- Education. Education has an important role in explaining empowerment. Lower levels of empowerment are usually associated to low levels of education (ISCED 1-2). The highest gap is found for Malta, the United Kingdom (UK) and the Czech Republic while the reverse is registered only for Norway and Bulgaria where respondents with low education score respectively 19% and 10% more than higher educated respondents.
- Income. Income seems to have an inverse relationship with engagement in Finland, the UK, Ireland, Norway and Denmark: high income respondents (overall 26% of the sample analyzed) result to be less engaged than respondents experiencing income shortages. The reverse holds for the rest of EU countries, and especially for Bulgaria, Germany, Poland, Portugal, and Romania. Income is not decisive in Cyprus, France, Iceland, Malta, and Spain.
- Language spoken. The language spoken is not decisive for defining consumer engagement in most of the surveyed countries, exceptions are Greece, Hungary and Italy where consumers speaking the official language are 30% more empowered than those using a different language. The opposite holds for Malta and the UK. As expected the dimension *Consumer skills* is driving the results in both directions (the only exception is the UK where consumers with a foreign language perform well above the native speakers in all dimensions).
- Internet use. Internet use seems to be related to empowerment: consumers with some experience in using internet have higher scores in skills, awareness and engagement (with the exception of Norway). The difference is large especially in Finland, where consumers not using internet are 50% less empowered, and in Malta, Poland and the UK where the gap is around 40%.

# 1. Introduction

---

As largely recognized by the scientific literature, the empowerment of a consumer is a multifaceted concept encompassing skills, competences and rights, as well as the ability of the consumer to gather and use information and the capacity of the market to provide legal and practical protection devices. The EU Consumer Policy Strategy 2007-2013, 'Empowering consumers, enhancing their welfare, effectively protecting them' (COM(2007) 99 final), indicates that 'empowered consumers need real choices, accurate information, market transparency and the confidence that comes from effective protection and solid rights'. On the other hand, policy processes without tangible goalposts are meaningless.

It is to answer to these political needs that DG Health & Consumers and DG ESTAT lunched in 2010 a Eurobarometer survey on consumer empowerment (Special Eurobarometer n. 342) aiming at collecting internationally comparable data on three main aspects:

- Consumers' skills: consumers' basic numerical and financial skills as well as their knowledge of logos and symbols;
- Consumers' level of information: consumers' knowledge of their rights (awareness of unfair contractual terms, unfair commercial practices, guarantee rights, distance-purchasing rights, etc.), of prices, of governmental and non-governmental institutions protecting them and of different sources of information about consumer affairs;
- Consumers' assertiveness: consumers complaint and reporting behaviour, as well as consumers' experience with misleading or fraudulent offers.

The dataset resulting from this initiative covered 29 countries (EU27 plus Iceland and Norway), and reached 56,470 consumers (on average 2,000 consumers per country) aged 15 and above.

Using this survey the DG Joint Research Center (together with DG Health & Consumers) constructed a composite measure of consumer empowerment encompassing the plurality of aspects implied by the EU policy Strategy.

The Consumer Empowerment Index (CEI) is a pilot exercise, aimed at obtaining a first snapshot of the state of consumer empowerment as measured by the Eurobarometer survey. It is neither a final answer on empowerment nor a comprehensive study on all the different facets of consumer empowerment, but instead it is meant to foster the debate on the determinants of empowerment and their importance for protecting consumers.

This report is structured as follows: the first part introduces the concept of consumer empowerment as developed by the specialised literature over the last 20 years. Section 3 describes the dataset and how we constructed the 22 indicators used in the Index. Sections 4 illustrates the statistical analysis of the dataset, while Sections 5 and 6 present the Consumer Empowerment Index and discuss some statistical issues related to the framework and its robustness, including the set of weights used. Section 7 relates the Index to the socio-economic dimensions of the sample of consumer surveyed, like e.g. age, gender, income, internet use, etc. The objective of this section is to portray the features of the most vulnerable consumers. Section 8 concludes. Four Appendices complement the report detailing tables, data, statistical analysis and country profiles.

## 2. The concept of Consumer Empowerment

---

The interest and debate on the notion of ‘consumer empowerment’ has been rapidly increasing during the last decades. The literature, while assuming rather than explicitly supplying an agreed framework for the notion of consumer empowerment (Shaw, Brailsford, 2006), emphasises the connections with skills, competences, rights and the abilities of the consumer on one hand, and with greater choice on the other (Hunter, Harrison and Waite, 2006). Below we offer a brief (and necessarily incomplete) excursus into the literature on consumer empowerment leaving for Appendix 3 a discussion on the general notion of empowerment. A brief section on the operational definition of consumer empowerment concludes.

### 2.1 Consumer empowerment and markets

Social psychology and marketing literature are the main sources for the definition of consumer empowerment, both referring to the strategic role of consumers vis à vis of producers and to the role of information as an empowerment source.

In sociology Denegri-Knott, Zwick and Schroeder (2006) map the research on consumer empowerment presenting three dominant explanatory models: consumer sovereignty, cultural power and discursive power.

Under consumer sovereignty a consumer is empowered *when he or she is free to act as rational and self-interested agent. [...] consumers combine resources and skills to make producers do what they would not do otherwise...* (Denegri et al, 2006, page 963). Consumers' choices are thus positive instruments to direct and to correct the market, *which results in more efficient production, better and cheaper products, social progress, and increased general welfare (ibid.*

page 955). An important feature of this approach is the relationship between consumer empowerment and strategic behaviours. Following the game theoretic idea of a zero-sum game, power is distributed among the 'players' of the market, where gains on one side consist in detriment for the opposite part: the measure of empowerment is a 'function of assessing who influences whom more'. In this literature, empowerment has a long tradition, dating back to Adam Smith's *invisible hand* theory (The Wealth of Nations, 1776). Offsprings of the sovereignty model relate empowerment to the level of consumers' ability, skills, knowledge, motivations (Nelson, 2002; Pitt et al., 2002, Sirgy and Su, 2000); or relate empowerment to actions in defence of consumers rights: class actions, boycott, movements against specific producers (Friedman, 1996; Garret, 1987; Gueterbock, 2004).

In the cultural model the market is a place of conflict between consumers and producers where the latter try to condition and control consumers' choices. Consumer empowerment resides not in the simple capability to stand firm against these manoeuvring, but it implies a strategic behaviour, tactics to react to buyers' actions and *motivations and processes whereby communities of various form resist and attempt to distinguish them from markets* (Kozinets 2002, page 23 but also Kozinets et al., 2004). In this context quantitative studies to measure empowerment are less common, and cultural consumer power appears more connected to ethnographic and phenomenological research, often based on direct evidence, observation and interviews.

Finally, the discursive model recognises a positive role to the interaction between consumers and marketers, who are co-responsible of the market definition (Denegri-Knott, 2004; Hodgson, 2000; Holt, 2002). Here empowerment is *the ability to construct discourse as a system [...] determine(s) what is true or false [...] the ability to the consumer to mobilize discursive strategies to determine what can know and what actions can be undertaken...* (Denegri et al., 2006, page 956). Researches in this field are interested in social, economic and juridical differences, cultures, and knowledge variety as drivers of empowerment or disempowerment. Added value of this literature is the identification of the internalised norms, codes, and rules, which represent the 'normal' consumer engagement.

The notion of consumer empowerment is also used in the marketing literature (Hunter and Garnefeld, 2008) to indicate both a subjective state/experience related to an increase in abilities (Wathieu et al., 2002) or an objective condition related to greater information or understanding (Brennan and Ritters, 2004; Rust and Olive, 1994). In this latter a wider choice, easier information access, and more generally higher education are the premises to empowerment and have, as consequence, greater consumer involvement. Wathieu et al. (2002) connect empowerment to consumer outcomes, and in particular, satisfaction. Does a greater empowerment imply higher satisfaction? The evidence is mixed: Goldsmith, 2005; Henry, 2005; Pitt et al, 2002 show that consumer empowerment is indeed an advantage for consumers while Dhar, 1997, suggests the risks connected to a more complex market and a greater choice that could generate increasing

introspection and judgement efforts (Brennan, 2005; Wilson et al., 1993) as well as the increased costs in terms of time necessary to make decisions (MacStavic, 2000).

Conger and Kanungo, 1988 in their definition of (individual) consumer empowerment as an enabling process highlight (among other aspects) two crucial aspects of information as enabler of empowerment: *source credibility* and *information framing* (referring to the positive or negative context of the message to consumers).

Pires et al. (2006), in the field of ICT, describe the transfer of power from the historical gatekeeper of the market, the suppliers, to the consumers, new holders, or co-holders, of such a power, thanks to greater availability and sophistication of choices. Consumer empowerment is not considered as the antithetic face of producers defeat in the market-game. On the contrary suppliers' strategies are a way to 'regain control over marketing process, that is, to manage the technological empowerment of consumers'. In this view, consumer empowerment appears as profitable for the market on both the buyer and the producer side.

Finally Len Tiu Wright, presenting a special issue on consumer empowerment in 2006, suggests that empowerment, and its experience, produces changes in consumers, *who become less passive consumers in accepting whatever is offered by suppliers*. She defines consumer empowerment, in marketing, as *a mental state usually accompanied by a physical act which enables a consumer or a group of consumers to put into effect their own choices through demonstrating their needs, wants and demands in their decision-making with other individuals or organisational bodies in the marketplace*. Consumer empowerment is *intrinsically peculiar to the individual consumer psyche*, [...] but it has *a beneficial effect in the short and long term of leading to improved business results* (Wright et al., 2006, page 926). The management efforts to enhance market environments are considered by the authors as products of consumer empowerment, in contrast with the more traditional visions based on exploiting and manipulating by the firms. According to this view "ignorance" is the real danger.

## **2.2 Consumer empowerment: towards an operational definition**

In the surveyed literature reported so far consumer empowerment remained an 'abstract' notion, lacking both a formally agreed definition and an operational specification of parameters that would allow us to measure it (also see *Benchmarking the performance of the UK framework supporting consumer empowerment*, 2008). It is clear that skills, competences, rights, information, consumer involvement should be part of this operational definition. More difficult is to specify and measure the capacity of the market to provide legal and practical devices to protect consumers.

According to the EU Consumer Policy Strategy 2007-2013<sup>3</sup>, empowered consumers need *real choices, accurate information, market transparency and the confidence that comes from effective protection and solid rights* (page 5). Moreover, it is recognised as a major objective that of ensuring *the effective application of the rules notably through enforcement cooperation, information, education and redress* (page 6). The concept of consumer empowerment seems therefore to build on knowledge, skills and assertiveness, while it is accepted that it can derive from different sources, including consumer education, valuable information, and institutional regulations.

In particular the following elements seem to be important for a definition of empowerment:

- consumers should be aware of their decisions when buying (e.g. terms and conditions, comparing prices, products' labels);
- consumers should be able to get information on their rights;
- consumers should have access to advocacy and redress mechanisms.

These three elements are those surveyed by Eurobarometer and captured in the Consumer Empowerment Index.

To the extent that consumer empowerment is outcome driven, the public authority ought to be capable of identifying features of the market which impede the realisation of consumer benefits or cause consumer detriment, and put in place the necessary tools to deal with such problems: *empowered consumers are thus capable of making informed choices, which in turn requires a consumer empowerment regime to put in place the tools for consumers to secure the best possible outcome for themselves [...]* (Benchmarking the UK Framework Supporting Consumer Empowerment, page 30).

## 2.3 The Consumer Empowerment Index and its components

The Consumer Empowerment Index is a composite measure constructed from a set of 56,470 individual data gathered from the Special Eurobarometer n°342. The structure of the Index is reported in Figure 1. We consider 22 indicators grouped in 3 main dimensions of empowerment: (1) *Consumer skills*, (2) *Awareness of legislation on consumer rights* and (3) *Consumer engagement*. The index has a pyramid structure: the Index is the weighted average of three pillars (Skills, Awareness and Engagement). Each pillar is the weighted average of a variable number of sub-pillars and finally each sub-pillar is made by various indicators constructed from the survey questions. Weights are either decided by the experts of DG Health & Consumers or obtained via the Consumer Market Expert group (see section 5.1).

---

<sup>3</sup>COMMUNICATION FROM THE COMMISSION – EU Consumer Policy strategy 2007-2013 - 'Empowering consumers, enhancing their welfare, effectively protecting them' COM(2007) 99.

The first pillar measuring *Consumers Skills* uses 6 questions divided into 2 sub-pillars: *Basic Skills* and *Logos and Labels*. The pillar aims at measuring the ability to perform basic arithmetic operations deemed necessary for consumers to make informed purchase decisions. It includes basic financial skills as the capacity to identify the best interest rate for a saving or deposit account, or the calculation of a yearly interest on a loan as well as the consumers ability to interpret packaging information (nutritional or “best before” dates). The correct identification and interpretation of various commonly used EU logos related to consumer information and protection is also included in this pillar.

The pillar *Awareness of consumer legislation* gathers together 7 indicators grouped in 3 sub-pillars: *Unfair practices*, *Cooling off period*, and *Guaranteed period*. The pillar describes the actual knowledge of consumers of several pieces of EU consumer legislation related to unfair commercial practices, length of guarantee rights validity, cooling-off period in distance or doorstep selling.

**Figure 1. Framework and weights of the Consumer Empowerment Index** (the budget allocation weights for the three pillars are detailed in Table 6)

Pillar	Sub-pillar	Indicator
Consumer Skills	Basic skills (0.5)	QA42: Recognize cheaper product (0.25)
		QA43: Find the best interest rate (0.3)
		QA44: Calculate the interest on a loan (0.45)
	Capacity to read logos /labels (0.5)	QA45: Correct interpretation of "grams of fat" (0.2)
		QA46: Find expiring date for a product (0.3)
		QA47(b): Recognize correctly logos (0.5)
Awareness of consumer legislation	Unfair commercial practices (0.4)	QA8: Rule for illegal advertisement (0.33)
		QA11: Rule for gifts received by post (0.33)
		QA13: Rule for advertising prices (air tickets) (0.33)
	Cooling-off period after purchase (0.4)	QA6: Rule for money back guarantee (0.33)
		QA9: Rule for the purchase of car insurance (0.33)
		QA10: Rule for door-to-door sales (0.33)
	Guaranteed period (0.2)	QA7: Rule for commercial guarantees
Consumer engagement	Comparing products (0.2)	QA17: Comparisons when purchasing a good (0.5)
		QA18: Actual behavior in comparing products (0.5)
	Reading terms and conditions (0.2)	QA14-15: Reading terms and conditions
	Interest in consumer Information (0.2)	QA16: Knowledge of consumer organizations (0.33)
		QA40: Knowledge of programs related to consumer rights (0.33)
		QA41: Actual behavior in obtaining info on consumer rights (0.33)
	Tendency to talk (0.2)	QA25: Tendency to communicate negative experiences (0.5)
		QA26: Tendency to communicate positive experiences (0.5)
	Detriment and redress (0.2)	Combination of the questions QA27, QA28, QA31, QA36, and QA37: actual behavior when experimenting problems for which there is a legitimate cause for complaint

*Consumer engagement* is the most heterogeneous pillar as it refers to many different aspects of consumer behaviour. The *Attitude in comparing products* (2 indicators) aims at measuring the effort consumers make in obtaining information on products. Reading specialized consumer magazines, using internet, visit different shops, or just talking with friends and family are some of the available options. This sub-pillar also includes the consumer attention to price differences. The sub-pillar *Consumers habits when reading terms and conditions* (2 questions combined in one indicator) aims at capturing consumers' behaviour when signing contracts: do they read carefully and completely terms and conditions? If not, why?

The sub-pillar *Interest in obtaining information on consumer rights* (3 indicators) measures the pro-active attitude of consumers when looking for information on their rights or when following specialized TV (radio) programmes. It also includes the knowledge of organizations protecting consumer rights. The sub-pillar *Tendency to talk* (2 indicators) aims at capturing consumer attitude to talk about negative and/or positive experiences. This is the only aspect of consumer empowerment we could not extensively survey in the literature. Finally the sub-pillar *Detriment and redress* is related to consumers' attitude when experiencing a problem causing a legitimate case for complaint. This was the most difficult sub-pillar to construct, due to the structure of filtered questions (see Appendix 1 for details). Finally we have chosen to combine 5 questions describing the actions taken by consumer when experiencing problems.

The attribution of numerical scores to each question has been done in tight collaboration with DG Health & Consumers. All the details of the construction of the indicators starting from the survey questionnaire can be found in Appendix 1.

### **3. The dataset**

---

The Special Eurobarometer n°342 contains about 70 questions on Consumer empowerment and on the socio-economic characteristics of the respondents. The questionnaire has been administered to 56471 respondents in 29 countries (EU 27 member states plus Iceland and Norway) through face-to-face interviews.

The data were collected over two waves: the first wave was held from 26 February to 17 March 2010 and involved 28.304 consumers; the second wave took place from 12 March to 1 April 2010 and covered of 28.167 consumers.

From the complete questionnaire we chose 27 questions to compile 22 indicators measuring different aspects of consumer empowerment. The remaining questions were discarded mainly for three reasons:

1. when it was impossible to relate the question to a measure of empowerment (e.g. QA12: have you personally brought airline tickets over the last 12 months? Or QA23: Over the past 12 months did you buy or order any good or service over the internet?);
2. when the question depended on the use/not use of internet. For example QA21 and QA22: did you read the conditions when you purchased a good or a service over the internet? If not, why? The answer of this question depended on the use of Internet. More than 1/3 of the sample (those not using internet) could not answer, so the inclusion of this question in the Index would have implied discarding a substantial part of the sample.
3. when the questions were related to the socio-economic background of respondent.

To take into account the information contained in these questions (especially for cases 2 and 3) we extracted sub-samples of respondents, those possessing the desired characteristics, e.g. education, age, use of Internet, etc., and we calculated the Index evaluating the differences in scores and ranks with respect to the full sample.

Original questions were all in an ordinal scale<sup>4</sup>, most of them dichotomous<sup>5</sup>. Some questions implied a multiple choice and some others contained filters (e.g. if the respondent answers category 1 and 6 in question X, then he/she is interviewed in question Y, if the respondent answers category 2,3,4, 5 in question X then he/she is interviewed in questions Z). Whenever possible we combined the filtered questions to construct a unique indicator able to resume all available options. This happened for QA14 and QA15 and for QA27, 28, 31, 36, 37. Together with DG Health & Consumer, we assigned scores to each question. Scores vary within [0, 10] with 10 associated to the correct answer and 0 associated to the wrong answer. The details of the codification of questions are in Appendix 1.

In the Eurobarometer survey the sample design used in each country was not able to give all the individuals in the population aged 15 and above precisely the same chance of selection (all surveys share this problem). Therefore raw data had to be corrected to avoid under or over representation of certain group of respondents, e.g. retired people, male/female, respondents living in cities or in the countryside, etc. The company conducting the survey provided a set of design weights to correct for the different probabilities of selection. This set of individual design weights therefore theoretically corrects each country sample for the following features: (i) stratification of the sample with respect to the reference population

---

<sup>4</sup> Usually allowing answers of type: High, Medium, Low.

<sup>5</sup> Dichotomous data are data from outcomes that can be divided into two categories (e.g. female/male, yes/no), where each participant must be in one or other category, and cannot be in both.

(the population aged 15 and over) in terms of age and gender; (ii) sample characteristics in terms of geographical location of the respondents.

It was not clear to which extent the design weights supplied corrected for the population size in order to make European countries comparable. Lacking this information, we opted for not adding any other design weight to our figures to correct for the representativeness of each country in Europe. European Average is thus calculated as the simple arithmetic average of the values by country (themselves calculated starting from raw figures weighted with design weights).

Notice that the design weights should not be confused with the set of weights attached to each indicator to obtain the composite. The first set of weights corrects a biased sample, whereas the second set is a measure of the importance (or trade-off) of each indicator in the composite and will be discussed in the following sections.

After applying the design weights to the dataset raw data were no longer distributed between 0 and 10 so we had to rescale the sample. We used the max-min scaling (i.e. for each question and each individual score we subtracted the sample minimum and divided by the sample range). Notice that the min and the max used were those of the whole dataset (and not the min and max of each country). This is to avoid equating average respondents in poorly scoring countries with exceptionally highly scoring respondents in virtuous countries. The dataset so normalised had all individual scores ranging from 0 to 100. Each country score has been calculated taking the sample average of all country's individual values. Sample average has been preferred to the median (or to other measures of central tendency) because it rewards higher performances.

## 4. Statistical dimensionality of the framework

---

As explained by the OECD-JRC handbook on constructing composite indicators (OECD-JRC 2008<sup>6</sup>), there exists an “ideal sequence” of steps to construct a composite indicator, from the development of a theoretical framework to the analysis of detailed data, once the indicator is built.

A preliminary univariate and multivariate analysis is the first step in assessing the suitability of the dataset and it is useful to understand the implications on ranks and scores of the methodological choices, e.g. weighting and aggregation, used during the construction of the composite indicator. In particular

---

<sup>6</sup> See <http://composite-indicators.jrc.ec.europa.eu/>

univariate analysis allows the assessment of each indicator with respect to e.g. missing data, outliers, the presence of skewness and kurtosis. This statistical check aims at finding anomalies in indicators that could influence the analysis (like the presence of outliers that could bias calculations). Multivariate analysis (and especially Principal Component Analysis) helps the analyst to decide whether the nested structure of the composite indicator is well-defined and if the set of available individual indicators is appropriate to describe the phenomenon.

This section presents the results of the univariate analysis and of the principal component analysis conducted to attest the validity of the structure (pillars, sub-pillars and indicator-association). Further details are in Appendix 1.

## **4.1 Univariate analysis**

Univariate analysis is essentially carried out to discover anomalous pattern in each indicator. In this dataset missing data are not an issue since missingness is related to the nested structure of the questionnaire.

In the Index 13 out of 22 indicators are dichotomous and assume values 0 or 10, this generates in most of the cases skewed distributions highly concentrated either towards ten or zero. In the pillar Skills the indicators (all dichotomous but one) assume value 10 (the maximum value) for more than 81% of the observations in the sample. Questions QA9 and QA41 are equal to zero in 75% and 87% of the cases respectively and QA8 is equal to ten in 75% of cases. Questions QA42, QA43 and QA46 are equal to ten in above 80% of the cases (the high concentration of the values is reflected by the low standard deviation and coefficient of variation). This raises some concerns on the informative power of these indicators and, as consequence, on the low range of variability for the composite. Appendix 1 shows the plots of all indicators.

The distribution of the indicators is non-homogenous across countries. In the pillar Skills Bulgaria behaves differently with respect to the other countries in question QA47B. Peculiar behaviour is found in Poland (QA46), Portugal (QA44), Romania (QA44 and 47B) and Spain (QA45). In the Pillar Awareness strongly peculiar distributions have not been detected, while in the pillar Engagement Norway and Iceland shows a different behaviour in QA25 like Poland and The Netherlands in question QA26. The distribution of each indicator in each country can be found in Appendix 1.

## 4.2 Multivariate analysis

Multivariate analysis, and in particular Principal Components Analysis is used to compare the theoretical framework with the statistical “framework” emerging in the dataset analysed.

**Table 1. Spearman correlation at the individual level (data multiplied by design weights)**

Skills	QA42	QA43	QA44	QA45	QA46	QA47

Red: values not significant at 5%

Principal component analysis (PCA) is a statistical technique that linearly transforms an original set of indicators into a substantially smaller set of uncorrelated factors, the principal components, while retaining as much as possible of the variation present in the dataset.<sup>7</sup> The principal components theoretically portray the latent factors hidden in the dataset. PCA is therefore appropriate in a framework where a composite aims at capturing multidimensional aspects of an undefined concept like consumer empowerment. Ideally a framework is confirmed if the number of latent factors is equal to the number of pillars/sub-pillars of the index. Likewise a pillar/sub-pillar dimension is confirmed if a unique latent dimension is found. In the case of the Consumer Empowerment Index we could not perform this latter analysis because sub-pillars do not contain enough indicators; we conducted a PCA on the whole set of indicators and on the pillars using the standard correlation matrices on the dataset weighted with design weights.

<sup>7</sup> A description of PCA can be found in J, E., Jackson (2003), *A user's guide to principal Components*, Wiley series in probability and statistics, John Wiley & Sons, Hoboken, New Jersey. See also Jolliffe, I.T., (2002). *Principal Component Analysis (2<sup>nd</sup> edition)*. New York: Springer-Verlag.

Before using individual data to perform the PCA we checked for the existence of linear correlation at the individual level (i.e. using individual data, see Table 1). The Spearman rank correlations of the whole dataset are all significant at the 5% level except few cases (QA-all with QA41 and QA14-15 with QA9). Yet, the correlations are low (below 0.33) especially within the pillars Awareness and Engagement, negatively influencing the results of the PCA.

The analysis has been performed also on the whole dataset and at the pillar level for raw data without design weights with the aim of assessing the impact of the weighting design on the latent dimensions of the Index.

### ***a. Whole dataset***

The principal component analysis on the data without design weights (henceforth raw data) reveals the presence of 7 relevant factors explaining only 47.4% of the variance of the dataset.<sup>8</sup> Ideally, therefore, PCA identifies 7 latent dimensions whereas CEI counts 3 pillars and 10 sub-pillars. The low percentage of the variance explained (due to the low overall correlation of the dataset) explains the low performance of PCA. The first factor alone accounts for 13.9% of the total variance while the remaining factors explain between 6.9% (second component) and 4.4% (seventh component) of the total variance (Figure 2.a).

The same analysis repeated on the data multiplied by design weights reveals the existence of 5 relevant factors accounting for 47.36% of the variance of the dataset. The application of the design weights, while marginally changing the number of factor (all explaining a low percentage of variance) improves the relevance of the remaining ones, especially the first factor that now accounts for 26.1% of the total variance. The remaining factors explain between 6.1% (second component) and 4.8% (fifth component) of the total variance (Figure 2.b).

The inspection of the loading factors (Table 2)<sup>9</sup> reveals that, independently of the dataset used (with or without design weights), the indicators have significant and autonomous explanation power: although the signs of the loadings corresponding to the first component (that is the component accounting for most of the variance) are the same for all the indicators, confirming that indicators correlate in the same direction with the most important latent dimension. The loadings are low, especially for QA14-15, reflecting the low correlation within the dataset, so the PCA is not decisive to infer the structure of the whole CEI.

---

<sup>8</sup> Following Kaiser (1960), a principal component is considered relevant when its eigenvalue is superior or equal to 1.

<sup>9</sup> A factor loading is the correlation coefficient between the indicator and the factor. The squared factor loading is the percent of variance (i.e. information) in that indicator explained by the factor.

## ***b. Pillar-level analysis***

### *Consumer skills*

The pillar Consumer Skills displays an acceptable level of correlation (Table 1). This is reflected in the results of the principal component analysis conducted on the raw data. PCA suggests the existence of 2 relevant factors explaining respectively 35.8% and 16.5% (in total the 52.2%) of the variance of the dataset. Given that this pillar is composed by 2 sub-pillars the finding seems to confirm the framework of the index. Design weights, however, induce some manipulation in the dataset; the PCA on the data multiplied by design weights, in fact, indicates the presence of only one principal component explaining 51.9% of the variance (Figure 3).

The loading factors between the indicators and the first principal component have the same signs in both datasets confirming that these indicators correlate in the same direction with the most important latent factor (Table 3). A perfect matching between the statistical and the theoretical frameworks would entail the two components loading principally the respective indicators (QA42,43,44 in the first and the rest in the second). This is partially the case. Table 3a shows that indicators QA43 (belonging to the Basic skills sub-pillar) and QA46 (covered by the Logos and labels sub-pillar) loads with the same principal component suggesting that they explain the same latent characteristic of consumer empowerment. Furthermore, this table displays a good correlation between the question QA47 and the first principal component. Finally, the same analysis on the weighted data, could be an argument for not breaking this pillar down into sub-pillars (Table 3b). Overall the statistical analysis confirms the structure of this pillar for the raw data. Results for data with design weights are less clear pointing to the existence of a unique relevant latent dimension.

**Figure 3. *Consumer Skills*: Scree-plot of the principal components**

QA42	0.42
QA43	0.40
QA44	0.37
QA45	0.40
QA46	0.43
QA47B	0.42

*Awareness of consumer legislation*

In this pillar the Spearman correlation at the individual level is much less pronounced. The PCA on the raw data shows a number of principal components – 3 – that is identical to the number of its sub-pillars. The variance explained by this 3 principal components ranges between 23.9% of the first and 14.1% of the third (overall, they account for 53.8% of the total variance). In the case of the weighted data, only two principal components are detected accounting for 44.8% of the total variance (the first explains 29.7% of the variance).

Furthermore, the analysis of the loading factors suggests that the indicator QA11 has an autonomous behaviour, being loaded alone by one factor (Table 4).

All together, these findings highlight that the theoretical framework of the pillar is confirmed with the usual caveats due to design weights presented above

**Figure 4. Awareness of consumer legislation: scree-plot of the principal components**

QA10	0.44	-0.39
QA7	0.37	-0.01

Consumer engagement

The principal component analysis of this pillar detects 4 relevant factors (this pillar has 5 sub-pillars in the CEI) in the raw dataset explaining 58.2% of the variance, ranging from 22.9% of the first component to 10.7% of the fourth one. The same technique identifies 3 principal components in the weighted dataset accounting for 53.9% of the variance, ranging between 29.7% of the first component to the 11.3% of the third one (Figure 5).

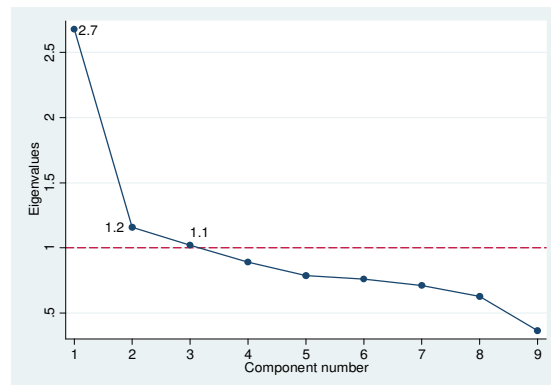

The indicators QA14-15 and QA27\_ALL seem to be stand-alone and are loaded in separate factors (both indicators are constructed starting from filtered questions). The loading factors analysis conducted on both datasets (raw and weighted data), while confirming the aggregation of the indicators QA25 and QA26 into an independent sub-pillar, it suggests some degree of communality between the indicators QA41 (covered by the sub-pillar on Interest in information) and QA27\_ALL (the Detriment and redress sub-pillar) into the same sub-pillar (Table 5).

**Figure 5. Consumer engagement: scree-plot of the principal components**

**5.a) Data without design weights**

**5.b) Data multiplied by design weights**

Overall the statistical analysis confirms the framework in the case of raw data. Less in the case of weighted data suggesting a relevant impact of the design weights.

## 5. The Consumer Empowerment Index

---

### 5.1 A set of weights for the Index

Central to the construction of a composite index is the need to combine in a meaningful way different dimensions measured on different scales. This implies a decision on which weighting model will be used and which procedure will be applied to aggregate the information. Weights should ideally be selected according to an underlying and agreed, or at least clearly stated, theoretical framework. Weighting imply a “subjective” evaluation, which is particularly delicate in case of complex, interrelated and multidimensional phenomena. The menu of weighting methods is rather large and increasing with the creativity of the practitioners. Ideally, weights should reflect the contribution of each indicator to the overall composite. Different weights may be assigned to component series in order to reflect their economic significance (collection costs, coverage, reliability and economic reason), statistical adequacy, cyclical conformity, speed of available data, etc.

Most composite indicators rely on equal weighting, i.e., all indicators are given the same weight. This could correspond to the case in which all indicators are “worth” the same in the composite. Statistical models such as *principal components analysis* or *factor analysis* (Nicoletti et al., 2000) or *benefit of the doubt* (Melyn and Mosen, 1991, and Cherchye et al., 2004) can be used to weight individual indicators. Alternatively, *participatory methods* that incorporate various stakeholders -- experts, citizens and politicians -- can be used to assign weights. This is the way followed in the Consumer Empowerment Index.

We decided in agreement with the DG Health & Consumers to follow a two-step procedure. The set of weights within each pillar (detailed Figure 1), have been chosen by DG Health & Consumers experts. The weights of the main three pillars (Skills, Awareness and Engagement) instead have been elicited using a participatory approach, whereby a group of experts are asked to provide this information. This technique is known as Budget Allocation.<sup>10</sup> By using the Budget Allocation technique we intended to provide a more systematic representation of experts’ opinion tempering the temptation of presenting the Index as “objective”. The reader should bear in mind that, no matter which method is used, weights are essentially value judgments and have the property to make explicit the objectives underlying the construction of a composite (Jacobs et al., 2004).

To elicit the set of weights used in the CEI, we asked each of the 20 participants of the Consumer Market Expert Group to allocate 100 points to the three dimensions of consumer empowerment. This produced 20 different sets of weights and obliged us to find a measure of central tendency to construct an “official” weight for the CEI (see Table 6). The small sample size suggested the use of the median instead of the average of the 20 sets of values, as it is less sensitive to outliers as compared with other measure of central tendency. In any case the median is very similar to the mean, so similar to produce about the same scores and exactly the same ranks. More interesting is the range of variation of the weights. Provided that no expert gave 0 points to any dimension (Skills, Awareness and Engagement) the minimum weight ranged between 15 and 20 and the maximum between 50 and 60. The implication of this variability will be discussed in the section dedicated to the robustness of the Index, where all the 20 set of weights are used to calculate alternative scores and ranks for the CEI.

<b>min</b>	20	20	15
<b>max</b>	60	60	50

## 5.2 Overview of the Index: scores and ranks

Table 7 presents the scores and ranks for the Consumer Empowerment Index. Norway leads the group of surveyed countries, followed by Finland and the Netherlands, Germany and Denmark (close together in terms of scores). At the opposite end Romania, Poland, and Bulgaria with a score 31% lower on average. Norway has the best score in the pillars *Consumer skills* and *Awareness of consumer legislation* but occupy the 22<sup>nd</sup> position in the pillar *Consumer Engagement* due to its poor performance in *Reading terms and conditions* and its below average performance in *Tendency to talk* and *Detriment and redress* (Table 8). Notice however that countries’ scores of the pillar *Consumer Engagement* are closer together than those of the remaining two pillars: In the first two pillars the worst three countries have an average score 38% and 40% lower than the upper 5, while this difference is 27% in the third pillar. Being so close, small differences in the score of two countries could result in high differences in their rank.

Furthermore, for all countries, the scores of the first pillar are higher than the scores of the remaining two pillars. This is due to the high scores obtained by all countries in questions QA42, QA43, QA46 (EU27

<sup>10</sup> For further details on the methodology please refer to the website <http://composite-indicators.jrc.ec.europa.eu/> on the section ‘publications - weighting indicators’.

average of 22.91, 22.93, and 23.45 respectively, see Table 20 at the end of the document) and the low scores obtained in the questions QA10 and QA16 (EU27 average of 9.76 and 9.61 respectively) but especially in questions QA41 (EU average of 3.37) and QA9 (EU average of 6.01). In all three pillars the range of variability is rather small: countries' scores are concentrated between 8 and 23.

Probably the best way to compare Consumer Empowerment is making 100 the EU27 average and calculating the distance of each country from this average. Figure 6. Consumer Empowerment Index, distance from the EU-27 average presents the results (the corresponding Table 19 is at the end of the document). The best performers have a score up to 20% higher than the EU27 average, while the low performers have up to 26% less. Awareness is the pillar where this gap is higher (reporting up to 42% higher and 37% lower), followed by Skills (reporting up to 25% higher and 33% lower). Engagement is where country performance is more uniform with 15% higher for best performers and 20% lower for low performers.

### 5.3 Association of CEI with individual perceptions

The survey questionnaire asks the respondents to express their opinion on whether, as consumers, they feel confident, knowledgeable, and protected. Using a simple correlation coefficient, we compare the scores of Index, pillars and sub-pillars with these perceptions (Table 9). Strong and significant relation is found with all indicators in the pillar Skills. Consumers who feel to be knowledgeable are also those who show higher basic skills and better capacity to read logos and labels. In the pillar Awareness perceptions seem to be related only to the knowledge of correct cooling-off practices when purchasing a good/service. Consumers who feel confident seem not to read completely and carefully terms and conditions when signing contracts, while they seem to be more interested in information on their rights as compared to non empowered consumers. Detriment and redress is not significantly related to the perception of protection

at 5% level but it is at 10% level. Further insights on the relation between reported behaviour and perceptions are in Section 7.8.

**Table 9. Correlation between CEI (pillars and sub-pillars) and individual perceptions.**

	Confident	Knowledgeable	Protected
Basic skills	0.64	0.69	0.69
Logos and labels	0.66	0.69	0.71
Unfair practices	0.04	0.10	-0.12
Cooling off	0.73	0.72	0.80

<b>CEI</b>	0.66	0.69	0.73

Red: values not significant at 5%

## 5.4 Influence of the design weights

The Consumer Empowerment Index is in theory distributed between 0 and 100, thus a score of 20 seems rather low. The design weights used to make the sample representative of the whole population aged 15 and above play in this case a fundamental role. Table 10 display the scores of the CEI and its pillars if the design weights are not applied. The difference is considerable: the 42.76% of Romania in Consumers skills becomes 12.16% when design weights are applied; a CEI score of 51 for the UK is worth about 15 with design weights in place. Probably the actual sample over represents elderly respondents: 38% of the sample is over 55 and one out of three is retired (see Appendix 3 for details of age distribution of the sample with respect to the whole population). These categories of respondent have the lowest CEI score which is made even smaller by a low design weight due to over-representation in the sample. We suspect that the correction for the place of residence also plays a relevant role in depressing the scores.

**Table 10: Consumer Empowerment Index. Scores of the Index and its pillars when design weights are not applied.**

Another option in order to verify the influence of design weights is to compare directly the survey indicators. In particular we averaged all individuals in each country in order to find 29 country values for each of the 22 indicators used in the composite. We made these calculations in two datasets: one weighted with design weights and the other un-weighted. Since weights change the range of variability for the figures in the dataset we could not compare “values” but just ranks (comparing values would have implied a further step of transformation to unify ranges). For each indicator the rank across countries was calculated. The result is a matrix with 22 columns (the number of indicators used) and 29 rows (the number of countries participating to the survey) where entry  $ji$  is the rank of country  $j$  in the indicator  $i$ . The same was done using weighed-data, the absolute value of the differences in ranks is in Table 11.

Overall, it seems that the design weights have a substantial impact on the absolute values of the scores but they do not alter in a significant way the relative performance of countries. The countries mostly affected are Finland, Malta and the Slovak Republic but on average less than 2 positions. Looking at the single indicators those belonging to the sub-pillar *Logo and Labels* are the mostly affected. Interestingly these indicators are not those suggested as “critical” by the correlation analysis (with the exception of QA25).

## 5.6 Association between the Index and its components

While in a composite is rather normal to have little (but positive) associations between pillars (pillars ideally describe different aspects of the underlined latent dimension the composite aims to capture), one would expect a certain degree of correlation between the indicators of the same pillar.<sup>11</sup> When this happens we could talk about a common “direction” for the indicators in the pillar. Problems could arise when the association is negative. In this case the negative sign could be the symptom of a trade-off between the indicators that aggregation dilutes. We calculate correlation both using the sample of individual answers and the sample of scores aggregated at the national level. The first gives a flavour of the correlation pattern at the disaggregated level; the second allows highlighting patterns at the national level.

<sup>11</sup> We warn the reader that correlation is a crude measure of association being limited to the linear case. It does not imply any cause-effect behavior.

Table 12 summarises the association between indicators and pillar scores (calculated at the country level). *Consumer skills* display all positive and statistically significant correlations. This is not the case for the other two pillars where most of the correlations are non significant at 5% and in some cases significant but with the negative sign (QA9: *Rule for the purchase of car insurance* with QA13: *Rule for advertising prices (air tickets)* in the pillar Awareness and QA41: *Actual behaviour in obtaining info on consumer rights* with the combination of QA14 with QA15: *Reading terms and conditions* in the pillar Engagement). Notice also that some indicators (e.g. QA11: *Rule for gifts received by post*, QA18: *Actual behaviour in comparing products*, QA25: *Tendency to communicate negative experiences*, QA\_ALL: *actual behaviour when experimenting problems for which there is a legitimate cause for complain*) are randomly related with the rest of its pillar.<sup>12</sup> On the other hand one has to remember that with judgemental data correlations can be much lower than with hard data (measurement errors are usually higher in survey data). Furthermore this questionnaire contained several filtered questions (QA14-15 and QA27-28-31-36-37 – we named it QA\_ALL). Overall it seems that the indicators used for the construction of the CEI follow different patterns in different countries.

**Table 12. Score correlation (country level) between indicators grouped in pillars**

Red: values not significant at 5%

The correlation between each indicator with the corresponding pillar has the expected sign and is in most of the cases significant with the exception of QA8: *Rule for illegal advertisement* and QA13: *Rule for advertising*

<sup>12</sup> The only significant correlation in the whole sample for QA18 is with QA8 and for QA25 is with QA7.

prices (air tickets) which seem to be a random noise for the pillar *Awareness* (Table 15 for the correlation at the national level) reflecting different behaviour in different countries. These two questions (together with QA11: *Rule for gifts received by post*) constitute the sub-pillar *Unfair practices* which therefore results non-correlated with *Awareness*. Questions QA18: *Actual behaviour in comparing products* and QA41: *Actual behaviour in obtaining info on consumer rights* are randomly related to the pillar *Engagement* (Table 13), though they belong to different sub-pillars so the rest of the indicators compensate the poor correlation improving the association to the corresponding pillars (Table 14).

Overall the CEI seems to be determined by the pillars Skills and Awareness with a correlation above 0.9 and 0.8 respectively, while the pillar Engagement contributes much less with a correlation of 0.6 (due to negligible contribution of indicators QA18, QA14-15 and QA25).

**Table 13. Correlation (country level) between indicators, pillars and the CEI scores.**

Pillar	Sub-pillar	Indicator	Correlation with Index	Correlation with Pillar
Consumer Skills	Basic skills	QA42: Recognize cheaper product	0.78	0.81
		QA43: Find the best interest rate	0.60	0.68
		QA44: Calculate the interest on a loan	0.82	0.89
	Capacity to read logos /labels	QA45: Correct interpretation of "grams of fat"	0.69	0.78
		QA46: find expiring date for a product	0.61	0.62
		QA47(b): Recognize correctly logos	0.86	0.91
Awareness of consumer legislation	Unfair commercial practices	QA8: Rule for illegal advertisement	-0.08	0.13

Red: values not significant at 5%

At the individual level we expect much higher correlations. Table 21 and Table 22 at the end of the document reports Spearman rank correlations at the individual level. In Table 21 all correlation are all significant but higher for the first pillar than for the other two. Rank correlation between indicators and its pillar is below 0.4 for QA9, QA16 and especially QA41. At the individual level the rank correlation between pillars and the composite is more balanced than at the national level. Correlation between pillars is relatively low signalling the fact that the pillars describe different aspects of consumer empowerment. The comparison between the correlations calculated on the individual scores and that calculated on the country scores suggests the existence of country specific patterns for certain indicators (e.g. QA8, QA13, QA16, QA18, and QA25).

Figure 7 plots the pillar values against the Index. It seems that the relatively low correlation between Engagement and CEI is mostly due to the performance of Norway (this country has very good score in every indicator and a score much higher than the EU27 average for the sub-pillar *Interest in information*), Romania and Bulgaria (due to the low values of *Detriment and redress* for both countries). Without these countries the correlation would be above 0.7. Country profiles in appendix provide additional insights.

Figure 7. Pillar values versus the ICE

## 6. Robustness of the results

---

The construction of composite indicators involves stages where judgments have to be made: the selection of individual indicators, the choice of a conceptual framework, the weighting of indicators, the treatment of missing values etc. All these sources of subjective judgments affect the message brought by the composite indicators in a way that deserve analysis and corroboration. A combination of uncertainty and sensitivity analysis (respectively UA and SA) can help to gauge the robustness of the composite indicator, to increase its transparency and to help framing a debate around it. In fact, UA focuses on how the sources of uncertainty propagate through the structure of the CI and affect its values. SA studies how much each individual source of uncertainty contributes to the CI value/ranking variance. Despite that a synergistic use of UA and SA has proven to be powerful (Saisana et al., 2005), UA is more often adopted than SA and the two types of analysis are almost always treated separately. Rather than broadly investigating the framework, the robustness analysis conducted for the Consumer Empowerment Index, is concentrated on the set of weights obtained through experts' elicitation and on the importance of each pillar. The framework, in fact, has been treated as given since it largely inspires the Eurobarometer survey, thus questioning the framework would have jeopardised the questionnaire itself given that data have been gathered with precisely that framework in mind.

### 6.1 Robustness of the weighting based on experts' elicitation

As mentioned above, for the construction of the CEI (henceforth the "baseline" CEI) we used the median of experts' votes for the three main pillars, Skills, Awareness and Engagement. To gauge the impact of this variability in country scores and ranks we calculated for each expert's set of votes scores and ranks and we computed the difference with respect to the baseline CEI.

Figure 8 displays the differences in scores for the CEI, where the baseline corresponds to the median of the experts' elicitations. The difference in experts' voting produces the largest effect for Norway followed by Iceland, Greece and Denmark.

**Figure 8. Box plot of CEI scores calculated with each set of weights obtained from Budget Allocation**

**Table 15. CEI ranks, maximum and minimum gain in ranks using all the Budget Allocation weights**

	<i>CEI</i>	<i>max gain</i>	<i>max loss</i>		<i>CEI</i>	<i>max gain</i>	<i>max loss</i>

LV	21	3	0	IS	9	2	3
LT	26	3	1	NO	1	0	2
LU	17	1	2				

At the lowest end Portugal, Spain and Poland with a reduced volatility in scores. The volatility of ranks is less pronounced (Table 15), the highest shift in rank is for Belgium with 5 positions, followed by Greece, Hungary, Malta and Spain (4 positions). Overall, the CEI results quite robust with respect to the change in

weights for its pillars: the volatility of scores is no higher than 13% of the baseline and the rank volatility is at most 5 out of 29 positions.

## 6.2 Importance of each pillar

The importance of each pillar in determining the CEI is evaluated by removing it from the analysis, rescaling the weights and calculating the shift in ranks produced. The rationale for eliminating one pillar at a time is to understand which is the “crucial” pillar for the overall CEI and for each country, i.e. the pillar with the highest impact on the Index overall and for each country.

Consumer skills, with a correlation 0.93 with the CEI, it is the pillar shaping the results of the Index. On average its removal produces a shift in rank of 2.5 positions (Table 16 and Figure 9). The most affected countries are Portugal with a change of 9 positions, followed by Iceland (7 positions), Belgium and the Czech Republic (both with 6 positions). The absence of the pillar Awareness produces at most a shift of 7 position for Greece and 6 positions for Malta. The loss of the pillar Engagement would mostly affect Belgium (by 6 positions), but has little effect for the other countries. The countries substantially unaffected by dropping one pillar at a time are Finland, France, Italy, Luxembourg, Poland and Romania where at most the shift in rank is of 1 position. Table 17 lists the most influential pillar(s) for each country with the corresponding shift in rank.

**Table 16. Eliminating one pillar at a time: average (absolute) shift in ranks with respect to the baseline CEI.**

## 7. Socio-economic aspects of consumer empowerment

---

The questionnaire on consumer empowerment contained a number of questions related to the socio-economic status of the respondents: age, gender, education, income, occupation, language spoken at home (if different from country-language), use of internet, etc. It would be interesting to explore the relationship between consumer empowerment and these socio-economic variables in order to identify the most vulnerable consumers and their features. Such an analysis would require the specification and estimation of an econometric model. Leaving this model for future analysis a faster way to relate consumer empowerment (as measured by the CEI) and the socio economic characteristics of the sample is to extract sub-samples, each of them possessing the desired socio-economic feature and calculate the Index value (including pillars and sub-pillars values). In order to make the sub-samples comparable between them and with the full sample we used the maximum and the minimum of the full sample when rescaling each sub-sample with the max-min approach. With this comparison we would like to offer a first hint of the most vulnerable consumers in Europe. We check the statistical difference between the full sample and the sample of respondents possessing a given socio-economic characteristic using the Wilcoxon Test.<sup>13</sup> Below, for each socio-economic characteristic we present the results as differences with respect to the EU27 average of the full sample. All the scores and ranks are in Appendix 4.

---

<sup>13</sup> The Wilcoxon Matched Pairs Test is a nonparametric test that compares the medians of two paired groups. If the P value of the test is smaller than a threshold (usually 0.05), one can reject the idea that the difference in the two samples is a coincidence, and conclude instead that the populations have different medians.

## 7.1 Gender

On average male respondents score systematically better than female in all pillars and the CEI even if 31.7% of them have the lead in shopping decisions vis à vis the 68.4% of female respondents.<sup>14</sup> The result is statistically significant. Overall education and internet use have a similar distribution in the two samples. This happens in all countries but Norway where female score higher than male in all three dimensions (Skills, Awareness and Engagement).

**Figure 10. EU-27 average scores for male (female) divided by the EU-27 average scores for the full sample**

In Cyprus, Lithuania, and Sweden female score higher in awareness and engagement, while female engagement is higher in Latvia, Iceland, the Netherlands, and Romania. The highest gap belongs to Malta where female respondents score about 40% less than male, followed by Poland and Ireland. The most “egalitarian” countries seem to be the Netherlands for Skills, Latvia for Awareness and Belgium for engagement. Figure 10 shows how distant is the EU average of each sub-sample from the EU average of the full sample

<sup>14</sup> The percentages come from the sub-sample of respondents to the questions qa57\_1 (everyday shopping, answer "more you") and the question D7 category SINGLE. This sub-sample collects the respondents actually taking shopping decisions.

## 7.2 Age

The age of respondents plays an inverse role in their empowerment: younger generations seem to be more skilled, aware and engaged than older generations, with the notable exception of Italy where the age cohort over-54 is 16.4% more engaged than the age cohort 15-24, 11% more aware of their rights and 6% more skilled.<sup>15</sup>

The highest difference between age groups is found in Sweden, Finland and Poland where respondents aged over-54 are up to 68% less empowered than the youngest respondents. The lowest difference is in Cyprus and Iceland with 7% and 15% respectively. The higher gap between age cohorts is found in Skills followed by Engagement and Awareness.

**Figure 11. EU-27 average scores for level of education divided by the EU-27 average scores for the full sample**

## 7.3 Occupation

Looking at the empowerment clustered according to the occupation of the respondents the most vulnerable consumers seem to be those retired or not working due to illness and those performing manual work (clearly age and education largely influence the result).<sup>16</sup> Overall the non active population is less empowered than active population, in 18 out of 29 countries the least empowered are retired consumers.<sup>17</sup> In 5 countries (the CZ, DE, EL, MT, AT) consumers not working (either unemployed or looking after the

<sup>15</sup> According to the Wilcoxon Matched Pairs Test the age group 40-45 has a median equal to that of the baseline CEI. In the remaining cases the test rejects the null hypothesis of equality of medians.

<sup>16</sup> According to the Wilcoxon Matched Pairs Test the sub-sample *unemployed or temporarily not working* and *Farmers* are statistically similar to the full sample (the null hypothesis of equality of medians is not rejected), while for all the rest of occupations the equality of medians is clearly rejected.

<sup>17</sup> These countries are: BE, BG, DK, EE, IE, ES, FR, LV, LT, HU, PL, PT, RO, SI, FI, SE, the UK, IS.

home), in IT, the NL, SK the least empowered are unskilled manual workers and in Cyprus are farmers.<sup>18</sup> In all countries but Italy students are among the most empowered followed by white collars.

**Figure 12. EU-27 average scores for occupation divided by the EU-27 average scores for the full sample**

**Non active population**

**Self-employed population**

<sup>18</sup> Outliers are found for (a) Luxembourg where the least empowered is in the professional group of business proprietors but the sample size of this group is equal to 1 individual; (b) Norway where the least empowered is in the group of Supervisors (sample size of the group is 9).

# Employed population

## 7.4 Education

Education has probably an important role in explaining empowerment. Lower levels of empowerment are usually associated to low levels of education (ISCED 1-2). The highest gap is found for Malta, United Kingdom and the Czech Republic while the reverse is registered for Norway and Bulgaria where respondents with low education score respectively 19% and 10% more than higher educated respondent. In Norway this pattern holds for the three pillars while in Bulgaria only for Skills and Awareness. Notice that in Norway 56% of sample interviewed has high educational attainment and only 9% (183 cases) has low attainment, whereas in the full sample (29 countries) the proportion is 22% higher educated and 30% with low educational attainment. The reason probably lies in the Norwegian welfare system that trains low-medium educated citizens to look for their rights (both legal rights and rights as consumers).<sup>19</sup>

**Figure 13. EU-27 average scores for education level divided by the EU-27 average scores for the full sample**

## 7.5 Income

The question chosen to represent the income of the respondent is *QA51: A household may have different sources of income and more than one household member may contribute to it. Thinking of your household's total income, is your household able to make ends meet (namely, to pay for its usual necessary expenses)...?* The possible answers were 8: *with great difficulty, with difficulty, with some difficulty, quite easily, easily, very easily, refusal to answer and don't know*. We disregarded the last two (about 1.300 observations), and grouped together *with great difficulty & with difficulty*, and *easily & very easily*, keeping separate the two remaining intermediate categories.

In Finland, the UK, Ireland, Norway and Denmark income seems to have an inverse relationship with empowerment: high income respondents (26% of the sample analyzed) result to be less engaged than respondents experiencing income shortages.<sup>20</sup> The reverse holds for the rest of countries, especially Bulgaria, Germany, Poland, Portugal, and Romania where respondents facing income shortages are 26-28% less empowered than wealthier respondents. Income is not decisive in Cyprus, France, Iceland, Malta, and Spain.

**Figure 14. EU-27 average scores for income level divided by the EU-27 average scores for the full sample**

<sup>19</sup> The Wilcoxon Matched Pairs Test always rejects the equality of medians for all subsets considered.

<sup>20</sup> The Wilcoxon Matched Pairs Test always rejects the equality of medians for all subsets considered except for the sub-sample *quite easily*.

## 7.6 Language spoken

The question chosen to represent the intra-EU migration is QA49: *Is your mother tongue different from the official language(s) spoken in (OUR COUNTRY)?*

We are aware that this question does not fully account for the migrant status, as (i) only EU citizens are interviewed, and (ii) there are migrants whose mother tongue does not differ from the official language (such as e.g. French or Dutch migrants in Belgium).

On average the language spoken is not decisive for defining consumer engagement, with the exceptions of Greece, Hungary and Italy where consumers speaking the official language are 30% more empowered than those using a different language (statistical tests confirm). The opposite holds for Malta and the UK. As expected the pillar Skills is driving the results in both directions (the only exception is the UK where consumers with a foreign language perform well above the native speakers in all dimensions).

**Figure 15. EU-27 average scores for language spoken divided by the EU-27 average scores for the full sample**

## 7.7 Internet use

Internet use seems to be related to empowerment: consumers with some experience in using internet have higher scores in skills, awareness and engagement (with the exception of Norway). The difference<sup>21</sup> is large especially in Finland, where consumers not using internet are 50% less empowered, and in Malta, Poland and the UK where the gap is around 40%. The pillar Skills displays the largest gap (Finland with 60%). Internet does not play a role only in Norway for the pillar Skills and in Cyprus for the other two pillars. The use of internet is highly correlated with education and age.

**Figure 16. EU-27 average scores for internet use divided by the EU-27 average scores for the full sample**

## 7.8 Perception of empowerment

The question used is QA48: *In general, when choosing and buying goods and services, how (1) Confident do you feel as a consumer?; (2) Knowledgeable do you feel as a consumer?; (3) Well protected by consumer law do you feel?* We chose to represent the extremes of the sample distribution and only extracted the sample of respondents answering they feel *very* or *quite* confident, knowledgeable and protected (the “optimists”) and those who feel they are *not very* or *not at all* confident, knowledgeable and protected (the “pessimists”).

<sup>21</sup> The Wilcoxon Matched Pairs Test confirms the significance of the differences.

The idea was to compare personal feelings with actual behavior, so we calculated the Index score for the sample of “pessimists” and optimists” to see whether consumers feeling confident, knowledgeable and protected are indeed those performing better in the index. The results seem to confirm it, with some caveats.<sup>22</sup> Danish and Italian consumers misperceive their skills (consumers feeling knowledgeable perform as good as those who does not feel the same); pessimist and optimist in Denmark and Spain score almost equally in Awareness, and pessimists in Iceland and Malta score slightly better than optimists in this pillar. The Engagement of Icelandic and Norwegians consumers seems to be unrelated to their personal feelings (Table 18, and Appendix 4). Overall, UK, Sweden, Poland and Germany display the highest match between actual performance and the individual feeling of confidence, knowledge and protection, whereas Iceland, Italy, and Spain have the poorest match.

**Figure 17. EU-27 average scores for empowerment perception divided by the EU-27 average scores for the full sample**

<sup>22</sup> Results are statistically significant

## 8. Conclusions

---

The 2007-2013 EU Consumer Policy Strategy emphasizes the importance of a better understanding of how consumers behave and sets as a main objective “to empower EU consumers”. It is to answer to these political needs that DG Health & Consumers and DG ESTAT lunched in 2010 a Eurobarometer survey on consumer empowerment aiming at collecting internationally comparable data on (i) consumers’ basic numerical and financial skills, (ii) consumers’ level of information on rights and prices, and (iii) consumers complaint and reporting behaviour, as well as consumers’ experience with misleading or fraudulent offers. The dataset resulting from this initiative covers 29 countries (EU27 plus Iceland and Norway), 56,470 consumers and contains 70 questions on empowerment and on the socio economic characteristics of each respondent. The DG Health & Consumers together with the DG Joint Research Center synthesized part of these data into a unique measure of consumer empowerment. The resulting Consumer Empowerment Index describes consumer empowerment along three main dimensions: *Consumer skills*, *Awareness of consumer legislation* and *Consumer engagement*.

According to the Consumer Empowerment Index Norway results to be the leading country followed by Finland, the Netherlands and Germany and Denmark. The middle of the ranking is dominated by western countries such as Belgium, France, and the UK, with an average score 13% lower than the top five. At the bottom of the Index are some Eastern and Baltic countries like Bulgaria, Lithuania, Poland, and Romania with a score 31% lower on average. The gap reaches 40% and 38% in *Awareness of consumer legislation* and *Consumer skills*, but drops to 28% in *Consumer engagement*. A group of southern countries, Italy, Portugal, and Spain score poorly in the Index, especially in the pillar *Consumer skills* where the gap with top performers reaches 30%.

This report (and its appendices) describes the steps followed in the construction of the Index and discusses the results. Particular attention is given to the definition of the theoretical framework, the quantification of categorical survey questions, the univariate and multivariate analysis of the dataset, and the set of weight used for calculating the scores and ranks of the Index. The report also discusses the robustness of the results and the relationship between the Index and the socio-economic characteristics of the respondents. We find that empowerment is directly associated to education, age, gender and internet use. Income is crucial only in some countries while the language spoken (if different from the official one) is on average not related to empowerment. Occupation is also important, on average the non active population is less empowered than active population.

The Consumer Empowerment Index is a pilot exercise, aimed at obtaining a first snapshot of the state of consumer empowerment as measured by the Eurobarometer survey. It is neither a final answer on empowerment nor a comprehensive study on all the different facets of consumer empowerment, but instead it is meant to foster the debate on the determinants of empowerment and their importance for protecting consumers.

# Appendix 1

## 1. Structure of the Consumer Empowerment Index

The Consumer Empowerment Index is a composite measure constructed from a set of more than 56,000 individual data gathered from the Special Eurobarometer n°342. The structure of the Index is reported in the main report (Figure 1). We consider 22 indicators grouped into 3 main dimension of empowerment: (1) *Consumer skills*, (2) *Awareness of legislation on consumer rights* and (3) *Consumer engagement*. The index has a pyramid structure: the Index is the weighted average of three pillars (Skills, Awareness and Engagement). Each pillar is the average of a variable number of sub-pillars and finally each sub-pillar is made by various indicators constructed from the survey questions.

**Table A1.1: Disregarded questions because of missing data**

Pillar	Disregarded question	Filtered by	Average	Missing (%)	
				Min	Max
Consumer skills	QA24	QA21	33.46	3.59(NOR)	60.32(BGR)
Awareness of consumer legislation	QA21	QA19	60.89	13.03(NOR)	92.02(BGR)
	QA22	QA19	77.75	36.4(NOR)	98.75(BGR)
Consumer engagement	QA32	QA27	79.86	55.09(NOR)	99.06(LVA)
	QA33	QA27	79.86	55.09(NOR)	99.06(LVA)
	QA34	QA33	82.85	59.93(NOR)	99.51(LVA)
	QA35	QA33	97.01	93.58(ESP)	99.56(LVA)

From the complete questionnaire we chose 27 questions to compile 22 indicators measuring different aspects of consumer empowerment. The remaining questions were discarded. The main reason for the exclusion is the high number of non-usable observations resulting from the nested structure of the questionnaire (Table A1.1). The statistic literature proposes different approaches for handling filtered data (Allison, 2002). A widely used method consists in the deletion from the sample of any non-usable

observations on any variable of interest (leastwise deletion). The application of this approach to the consumer empowerment survey, on average, would have implied the deletion of up to 97% of the observations from the dataset with a great loss of information.

Other methods imply some manipulation of the data introducing a dummy variable that, for each variable, signals the presence of a filtered observation (dummy variable adjustment) or substituting the non-usable values with some reasonable value (imputation approach). Unfortunately, these approaches are not suitable for the consumer empowerment survey because, given the strong nested structure of its questionnaire and the subsequent severe filtering problem, they may bias the data.

Therefore, the decision of discharging the questions listed in Table A1.1 is the result of a trade-off between the necessity to use the maximum amount of information that can be extracted from the data and to minimize the risk of distorting them. Furthermore, the information that is lost adopting this approach can be partially recovered stratifying the analysis between occupations, gender, levels of education, immigration statuses, and levels of internet familiarity. Concerning this point, as three out of the seven disregarded questions are filtered by items concerning the use of internet (namely QA24, QA21, and QA22 filtered by QA1 and QA19), the impact of the ICTs on consumer empowerment will be assessed comparing how this state differs between internet users and internet non-users.

Other reasons for exclusion are redundancy and the unclear link with the empowerment concept. The first motivation applies to questions QA32 and QA33 (filtered by QA27) that capture the same information as QA31; the latter one applies to questions QA12, QA39, and QA38 (not listed in Table A1.1).

## 2. Construction of indicators

---

Qualitative ordinal indicators cannot be used without the prior quantification of qualitative attributes. The strategy adopted for this quantification and, therefore, for the construction of the indicators used in the consumer empowerment index can be summarized as follows. The scores associated to the answer given to each selected question have been recoded so that their interval of variation is [0, 10]. According to the question, the value 0 has been attributed either to a wrong answer (see, for instance, the questions about consumer skills and awareness of consumer legislation - pillars Skills and Awareness), or to a “non-action” (e.g., the questions about consumer behaviour – pillar Engagement). On the other-hand, the value 10 has been attributed either to a correct answer (pillar Skills and Awareness) or to the behaviour that corresponds to a fully empowered consumer (pillar Engagement).

For all the questions (QA17 and QA18 are exceptions) the score of 0 point has also been assigned to the answer “don’t know” (DK).

The recodification strategy of the questions covered by the *Interest in information* sub-pillar (namely QA16, QA40, and QA41) accounts for country specificities. The normalized scores assigned to these questions are based on the percentiles of the country-distribution of their answers. The cases where the consumer could not give an answer to a question because she/he lacked the specific experience (i.e. never bought this kind of good, never signed this kind of contract, never had a problem, and never had a god experience) have been considered as “non-applicable”. These cases have been treated with a specific imputation strategy. For each indicator, the number of non-applicable answers has been eliminated from the original sample and randomly reallocated to the remaining categories.

After the application of this normalization strategy, while almost all the indicators covered by the pillars Skills and Awareness are dichotomous (the only exception is question QA47B that generates a categorical variable); pillar Engagement is composed of 8 multiple choice indicators (corresponding to the questions QA17, QA14-15, QA16, QA25, QA26, QA18, QA40, and QA27-28-31-36-37), and only one dichotomous indicator (associated to question QA41).

Details are reported below.

## **P1 – Consumer skills: *original questions***

- **BASIC SKILLS**

- QA42: The same flat-screen TV is on sale in both shop A and B. Which one is cheaper?
- QA43: Thinking now about savings or deposit accounts, which of the following would be the best interest rate?
- QA44: A family is charged interest at 6% per year on a 50.000 euro home loan. How much is the interest for the first year?

- **LOGOS AND LABELS**

- QA45: Looking at this picture, please could you tell me how many grams of fat there are in 100 grams of this product?
- QA46: Still looking at the same picture, could you please tell me by which date is it suggested you can eat this product?
- QA47: And could you select which of the statements you think is the right meaning for logo A (B, C, D, and E)?

# P1 – Consumer skills: *recodification*

- BASIC SKILLS

- QA42: Dichotomous, max score (10) to the correct answer (cat.2: shop B), min (0) to the others
- QA43: Dichotomous, max score (10) to the correct answer (cat.2: cat.4: 4%), min (0) to the others
- QA44: Dichotomous, max score (10) to the correct answer (cat.2: 3000), min (0) to the others

- LOGOS AND LABELS

- QA45: Dichotomous, max score (10) to the correct answer (1,5g/100g), min (0) to the others
- QA46: Dichotomous, max score (10) to the correct answer (June 2008), min (0) to the others
- QA47: Categorical, max score (10) to the correct answer (b1: cat.3; b2: cat.6; b3: cat.1; b4: cat.4; b5: cat2), min (0) to the others. For each respondent average for [b1-b5]

The vertical lines in the graph on the right indicates the lower (red) or the upper (green) boundary used to detect peculiar distributions at the country level. These lines are showed only if necessary.

## P2 – Awareness of consumer legislation: *original questions*

- UNFAIR PRACTICES

- QA8: An advertisement in your newspaper says: "Free sunglasses, just call this number to collect them". You call the number and later you discover that it is a very costly premium rate telephone number. Was the advertisement legal or illegal?
- QA11: Imagine you receive by post two educational DVDs that you have not ordered, together with a 50 Euros bill for the products. Are you obliged to pay the bill?
- QA13: Which rule do you think applies about advertising the price of air tickets?

- COOLING OFF

- QA6: Suppose you ordered a good by post, phone or the Internet, do you think you have the right to return the good you ordered 4 days after its delivery and get your money back, without giving any reason?
- QA9: Imagine you purchase car insurance over the telephone, the internet or by post. Two days later you discover a better deal with another provider and you decide to cancel the original contract. Do you have the right to do that?
- QA10: Imagine a salesman calls uninvited at your door demonstrating a vacuum cleaner. You buy the vacuum cleaner from him, but two days later you discover a better deal. Do you have the right to return the vacuum cleaner and get your money back without giving any reason?

- GUARANTEED PERIOD

- QA7: Imagine that a new fridge you bought 18 months ago breaks down. You didn't buy any extended commercial guarantee. Do you have the right to have it repaired or replaced for free?

## P2 – Awareness of consumer legislation: *recodification*

- UNFAIR PRACTICES

- QA8: Dichotomous, max score (10) to the correct answer (cat.2), min score (0) cat.1, cat.3, and cat.4.
- QA11: Dichotomous, max score (10) to the correct (cat.3), min score (0) to cat.1, cat.2, and cat.4.
- QA13: Dichotomous, max score (10) to the correct (cat.1), min score (0) cat.2, cat.3, and cat.4.

- COOLING OFF

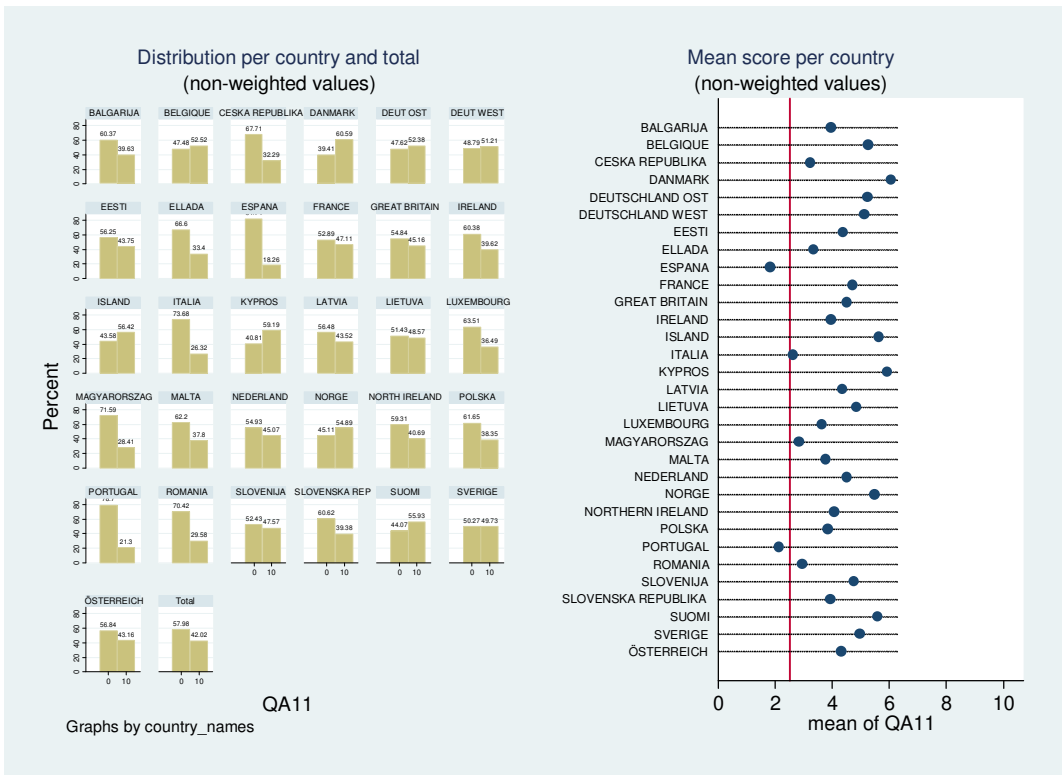

- QA6: Dichotomous, max score (10) to the correct answer (cat.1), min score (0) to cat.2, and cat.3.
- QA9: Dichotomous, max score (10) to the correct answer (cat.3), min score (0) to cat.1, cat.2, cat.4, and cat.5.
- QA10: Dichotomous,
  - For all countries except DK and LU: max score (10) to the correct answer (cat.1), min score (0) to cat. 2, cat.4, and cat.5.
  - For LU and DK the correct answers are: max score (10) to the correct answer (cat.3 and cat. 4), min score (0) to cat.1, cat.2, and cat.5.

- GUARANTEED PERIOD

- QA7: Dichotomous, max score (10) to the correct answer (cat.1), min score (0) to cat.2, cat.3, and cat. 4.

### **P3 – Consumer engagement: *original questions***

- COMPARING PRODUCTS

- QA17: Thinking about the last time you purchased a good, such as a household appliance or electronic good, which of the following did you consult in order to make a comparison?
- QA18: In the last 12 months, how often have you compared the price of goods by looking at the price per unit measure for example, price per kilo, per meter or per liter?

- READING TERMS AND CONDITIONS

- QA14: Please think about the last time you signed a contract for a service, for example, gas, electricity, mobile phone, bank account or insurance. Did you read its terms and conditions?
- QA15: Why did you not read it all?

- INTEREST IN INFORMATION

- QA16: Thinking about (NATIONALITY) consumer organisations or public agencies/ authorities, can you please name any organisations representing and protecting consumers in (OUR COUNTRY) that you have heard of?
- QA40: There are programmes on the TV (and radio), which show problems frequently encountered by consumers and provide advice on rights and actions to be pursued. How often have you watched or listened to such programmes during the last 12 months?
- QA41: In the last 12 months, did you go looking for information on your rights as a consumer?

- TENDENCY TO TALK

- QA25: I would now like you to think about the last problem you had as a consumer. This could be any problem, related to a good, a service, a retailer or a provider. How many people, apart from the employees of the business concerned, did you tell, in total, about the last problem you had as a consumer?
- QA26: I would now like you to think about the last good experience you had with a good, a service, a retailer or a provider. How many people, apart from the employees of the business concerned, did you tell, in total, about the last good experience you had as a consumer?

- DETRIMENT AND REDRESS

- QA27: In the past 12 months have you encountered any problems for which you had legitimate cause for complaint with a good, a service, a retailer or a provider?

- QA28: If you had experienced such a problem in the last 12 months, do you think that you would have made a complaint to the retailer, the provider or the manufacturer?
- QA31: As a consequence of the problem(s) you encountered, did you take any of the following actions?
- QA36: Thinking about the last time you encountered this kind of problem but didn't take the businesses concerned to Court, what were the main reasons for that?
- QA37: Thinking about the last time you encountered such a problem but didn't take the business concerned to an out-of-court dispute settlement body (ADR), what were the main reasons for that?

### **P3 – Consumer engagement: *recodification***

- COMPARING PRODUCTS

- QA17: 10 points to cat.2; 8 points to cat.3, cat.4, and cat.5 (for each respondent the average of these cat.s has been calculated); 6 points to cat.6; 4 points to cat.1, cat.7, and cat.9; 0 points to cat.10; cat.8 and 11 are considered as not applicable and assigned proportionally to the rest of the sample. For each respondent, the average score has been rescaled between 0 and 10.
- QA18: 10 points to cat.1 and cat.2; 5 points to cat.3 and cat.4; 0 points to cat.5; cat.6 is considered as not applicable and assigned proportionally to the rest of the sample.

- READING TERMS AND CONDITIONS

- QA14-15: 10 points to cat.1 in QA14; cat.4 in QA14 treated as not applicable and reassigned proportionally; 0 points to cat.5 in QA14; cat.2 and cat.3 in QA14 go to QA15 and recoded as follow:
  - 2 points to cat.2 and cat.5 in QA15
  - 3 points to cat.6, cat.7 and cat.8 in QA15
  - 4 points to cat.1, cat.3, and cat.4 in QA15
  - 0 points to cat.9 and cat.10 in QA15.

For each respondent, the average score has been computed.

- INTEREST IN INFORMATION

- QA16: For each country, calculate the ratio between the answer (number of associations known by the respondent) and the “second-best” answer in terms of number of associations known for that country (we eliminate the answers indicating the highest number since in many countries it constitutes an

outlier). Rescale this ratio in the interval [3 10]. Assign the max score to the 95th percentile and beyond (to avoid rewarding too much high answers). DK scores 0.

- QA40: For each country the median of the answers is calculated. Ten points are assigned to the categories below or equal to the country median (corresponding to a higher frequency in encountering TV/radio programs). Categories above the median are scored linearly. Zero points are assigned to cat. 4, cat.5, and cat.6.
- QA41: Dichotomous, max score (10) to cat.1 and min score (0) to cat.2, and cat.3

- TENDENCY TO TALK

- QA25: Lowest score (0) to cat. 99 and 00; cat.97 is considered equal to cat.1; cat.98 is considered as not applicable and assigned proportionally to the other categories. Linear scoring until the country median (starting at 1) and then 10 points.
- QA26: same as in QA25.

- DETRIMENT AND REDRESS

If QA27 is cat.2 and cat.3 go to QA28

If in QA28 the answer is cat. 1: 8 points

If in QA28 the answer is cat.2 and cat.3: 0 points.

If QA27 is cat.1 then go to QA31

If answers in QA31 belong to cat.1, cat.3, cat.4, cat.5, and cat.6 then go to QA36

If the answer in QA36 is cat.1, cat.2, cat. 9, and cat.10, then 0 points

If the answer in QA36 is cat.4, cat.6, and cat.7, then 5 points

If the answer in QA36 is cat.3, cat.5, and cat.8 then 10 points

Average for each respondent

If answers in QA31 belong to cat.2 then go to QA37

If the answer in QA37 is cat.1, cat.2, cat.10, and cat.11 then 0 points

If the answer in QA37 is cat.4, cat.5, and cat.7, then 5 points

If the answer in QA37 is cat.3, cat.6, cat.8, and cat.9 then 10 points

Average for each respondent

The vertical lines in the graph on the right indicates the lower (red) or the upper (green) boundary used to detect peculiar distributions at the country level. These lines are showed only if necessary.

### 3. Univariate analysis

Appendix 2 presents the univariate analysis of the indicators covered by each pillar, which aims at identifying distributional characteristics (e.g. asymmetry, central tendency) as well as potential outliers requiring a variable transformation. It also contains a brief description of the Principal Component Analysis discussed in the main report. The data used for the univariate analysis are raw data (prior to the multiplication with design weights) where Great Britain is separated from Northern Ireland and West and East Germany are split. For the calculation of the Consumer Empowerment Index they have been pulled together in United Kingdom and Germany.

#### 3.1 Descriptive statistics

##### 3.1.1 Consumer skills

The distributional characteristics of the indicators covered by the *Consumer skills* pillar are presented in Table A2.1 and in Figure A2.1.

**Table A2.1: Consumer skills - descriptive statistics**

Sub-pillar	Question	mean	sd	cv
Basic skills	QA42	8.199076	3.842678	0.468672
	QA43	8.120982	3.906372	0.481022
	QA44	5.745427	4.944165	0.860539
Logos and labels	QA45	6.058508	4.886715	0.806587
	QA46	8.278231	3.775374	0.45606
	QA47B	3.818526	2.788159	0.730166

sd= standard deviation; cv=coefficient of variation

Given that almost all the indicators in pillar 1 are dichotomous (the categorical variable generated by question QA47B is the only exception) and assume values 0 or 10, this table shows a rather right-skewed distribution for the indicators generated by questions QA42, QA43, and QA46.

**Figure A2.1: Consumer skills – Histograms**

Indicators QA42, QA43, and QA46 assume value 10 (the maximum value) in more than 81% of the observations. This raises some issues on their informative power (the high concentration of the values is also reflected by the low standard deviation and coefficient of variation). The same table and figure show that questions QA44, QA45, and QA47B generate more informative indicators, with observations mostly equally distributed between the minimum and the maximum value (respectively 0 and 10).

The distribution of these indicators is of course non-homogenous across countries. Distributional peculiarities at the country level have been detected applying the technique generally used to isolate the outliers (see Tukey, 1977<sup>23</sup>). According to this method, outliers are the observations outside the following two boundaries:

- Lower:  $L = p75 - \frac{3}{2}(p75 - p25)$
- Upper:  $U = p75 + \frac{3}{2}(p75 - p25)$

where  $(p75 - p25)$  is the interquartile difference. In this specific context, a country is said to have a “peculiar distribution” for a certain variable if its country-mean is below or above the lower and upper boundary respectively defined by Tukey (1977). For each indicator, countries below the lower boundary are characterized by a more left-skewed distribution than the one estimated on the whole dataset (all the

<sup>23</sup> We applied the technique proposed by Tukey because it is quite straightforward and because it is implemented by the most widely used statistical packages (i.e. STATA and SPSS).

countries together) and, similarly, countries above the upper boundary are characterized by a more right-skewed distribution than the one estimated on the whole dataset. Table A2.2 presents the results of this analysis and classifies the distributional peculiarities at the country level as negligible (marked with □), mild (marked with ◯), and strong (marked with ●). From this table it is possible to observe that Romania, Poland, Spain, Portugal, and Bulgaria<sup>24</sup> tend to behave differently than the other countries in the dataset in some of the indicators covered by the 1<sup>st</sup> pillar. Bulgaria scores especially low (on average 1.52 – the scores are between 0 and 10) as compared to the other countries (on average 4.05) in question QA47B . Peculiar behaviour is found in Poland (QA46: Poland scores 3.04 versus an average of 8.49 for the rest of countries), Portugal (QA44: Portugal’s average scores is 2.64 when the other countries score on average 5.99), Romania (Romania scores on average 2.19 for QA44 and 1.37 for QA47) and Spain (Spain’s average scores in QA45 is 2.48 while the remaining countries score on average 6.09). This suggests the presence of country effects that need to be considered for the interpretation of the results of the consumer empowerment index. The same analysis has been repeated for pillars 2 and 3.

<sup>24</sup> The countries are listed from the one with the higher number of indicators “peculiarly distributed” to the one with the lowest number of these indicators.

### 3.1.2 Awareness of consumer legislation

Table A2.3 presents some descriptive statistics for the indicators covered by the second pillar (*Awareness of consumer legislation*); Figure A2.2 complements this table. As already mentioned above, they are all dichotomous with minimum and maximum values respectively equal to 0 and 10.

**Table A2.3: Awareness of consumer legislation - descriptive statistics**

Sub-pillar	Question	mean	sd	cv
Unfair practices	QA8	7.49305	4.334171	0.578425
	QA11	4.201626	4.935892	1.174758
	QA13	5.945884	4.909759	0.825741
Cooling off	QA6	5.872218	4.92338	0.838419
	QA9	2.325973	4.224913	1.816407
	QA10	3.734129	4.837146	1.295388
Guaranteed period	QA7	4.229605	4.940336	1.168037

sd= standard deviation; cv=coefficient of variation

The observations are approximately equally distributed between the minimum and the maximum values for the indicators generated by questions QA11, QA13, QA6, QA10 and QA7. Therefore, these indicators seem to have a fairly good informative power.

The situation is different for the two remaining indicators. Question QA8 is equal to 10 in 75% of the cases and questions QA9 is equal to 0 in 76% of the cases.

Finally, the analysis conducted following the approach proposed by Tukey (1977) reveals that the indicators in this pillar have a quite homogenous distribution across countries. Strongly peculiar distributions have not been detected.

### 3.1.3 Consumer engagement

Table A2.5 shows some descriptive statistics for the indicators constructed for *Consumer engagement*.

**Table A2.5: Consumer behaviour – descriptive statistics**

Sub-pillar	Question	mean	sd	cv
Comparing products	QA17	2.446644	1.570271	0.641806
	QA18	6.756098	3.605021	0.533595
Reading terms&conditions	QA14-15	3.996799	4.341179	1.086164
Interest in information	QA16	3.269562	2.712057	0.829486
	QA40	5.838572	4.400916	0.753766
	QA41	1.204689	3.25512	2.702042
Tendency to talk	QA25	4.976101	3.77761	0.759151
	QA26	5.597343	4.1554	0.742388
Detriment and redress	QA27-28-31-36-37	4.493297	3.792752	0.844091

The two indicators constructed from QA25 and QA26 in the *Tendency to talk* sub-pillar have mean and median approximately identical as well as acceptable skewness and kurtosis values (respectively 0.46 and 1.65 for QA25, 0.21 and 1.42 for QA26).

Furthermore, while QA17, QA14-15 and QA16 have rather low mean and median values, only one of them – the indicator generated by the question QA17 – has skewness and kurtosis values above the Normal distribution threshold (i.e. skewness  $|1|$  and kurtosis 3)<sup>25</sup>. As expected, none of these indicators can be considered normally distributed in the interval 0-10 (Table A2.5 and Figure A2.3, see also Appendix 1).

<sup>25</sup> The skewness of QA17 is equal to 1.11 and its kurtosis is equal to 4.76;

**Figure A2.1: Consumer behaviour – Histogram of the QA17, QA14-15, QA16, QA25, Qa26.**

**Figure A2.3: Consumer behaviour – Histogram of QA18, QA40, QA27-ALL, QA41**

The indicator constructed from QA18 has a monotonically increasing distribution, while QA40 has a U-shaped distribution. The indicator constructed with QA27-28-31-36-37 (i.e. QA27-ALL) does never reach the maximum attainable (Table A2.5 and Figure A2.2).

Finally, question QA41 has a strong left-skewed distribution (it is equal to 0 in the 88% of the cases) rising some concerns about its informative power.

Table A2.6: Consumer behaviour – peculiar distributions by country

	QA17		QA18		QA14_15		QA16		QA40		QA41		QA25		QA26		QA_27_ALL

Regarding the country-level distribution of the indicators in the pillar, peculiar distributions – mild or serious – affect the indicators resulting from questions QA16, QA26, QA26, QA18, and QA27-28-31-36-37 without being concentrated on specific countries (Table A2.5). Iceland and Norway behave differently in question QA25 where they score exceptionally low (on average around 1.6) as compared with the rest of countries (on average 5.61). Poland is atypical in QA26 for the low value of its score (3.53 versus an average of 5.69 for the other countries).

## 1. Age distribution analysis histograms

---

The following section presents a comparative analysis of the sample population used for the Consumer Empowerment Index with the Eurostat population data by age group. The tables and figures display the deviation of the age distribution between the sampled consumers (raw data and data weighted with design weights) and the Eurostat population data as reference point. Only EU countries are considered here.

# Appendix 3

---

## 1. The concept of empowerment

---

The concept of empowerment is present in several disciplines, such as political science, psychology, sociology, management, and marketing (Sehgal & Stewart, 2004; Hur, 2006; Cannoy, 2009). We offer a brief excursus into this literature and some useful references.

A single understanding or a general consensus on the concept of empowerment does not exist (Mendes-Filho, Tan & Milne, 2010; Ergeneli, Arl & Metin, 2007), and numerous definitions, often within the same discipline area can be found (Pires, Stanton & Rita, 2006; Perkins and Zimmerman, 1995). In all disciplines, though, empowerment appears as multidimensional and multilevel. It refers to both individuals and the whole society, and is investigated as a process or/and as an outcome per se (Thomas & Velthouse, 1990; Parpart et al., 2003; Hur, 2006).

At individual level, empowerment is connected to self-determination, mastery and decision-making abilities, capacities and personal skills (Becker, Kovach & Gronseth, 2004), as well as to participatory mechanisms (Cox, 2002, Gutierrez, 1995). As stressed by Wilson (1996), there is a vast recognition, that individual changes are prerequisites, for social change and empowerment (Page & Czuba, 1999). A broad part of this literature treats empowerment as an outcome (Behm & Staples, 2002) to be measured and evaluated (Parpart et al., 2003) in relation to subjective conditions. As reported by Hur (2006), empowerment encompasses self-determination (Fetterman, 1996; Sprague & Hayes, 2000), self-confidence (Larson, Walker & Pearce, 2005), but also mastery (Boehm & Staples, 2004), personal sense of control and efficacy (Speer, 2000), advocacy and consciousness raising (Monreau, 1990). According to Thomas and Velthouse (1990) cognitive model, empowerment is the result of four component: *meaningfulness* which is related to the individual judgment based on personal scale of values,, *competence*, the degree to which a person can skilfully perform tasks, *choice*, which involves self-determination, and *impact*, the level to which tasks and goals are actually performed.

At the social or community level the accent is on group empowerment (Lee, 1997), collective empowerment (Staples, 1990), organizational and political empowerment (Gutierrez et al, 1998; Peterson & Zimmerman, 2004). This literature considers empowerment as a process embracing steps and

experiences *'through which people and/or communities increase their control or mastery of their own lives and the decisions that affect their lives'* (Kreisberg, 1992, p. 19). The central focus becomes the mechanism and the opportunities to gain control and to maintain it (Pires, Stanton & Rita, 2006; Perkins & Zimmerman, 1995). The sparse literature investigates single components empowerment, such as social cohesion, community engagement, and multiple dimensions, such as building community and culture building (Fetterson, 2002), intellectual understandings of power and social change (Speer, 2000), and leadership competence and political control (Zimmerman & Zahniser, 1991). Hur (2006) identifies a set of four components common to this literature: collective belonging, involvement in the community, control over organization in the community, and community building. *The goal of collective empowerment is to establish community building, so that members of a given community can feel a sense of freedom, belonging, and power that can lead to constructive social change* (Hur, 2006, page 535).

Zimmerman and Rappaport (1988, page 725) instead define empowerment in term of participatory process as *the connection between a sense of personal competence, a desire for and a willingness to take action in the public domain*, bridging the gap between the individual and the collective empowerment. The concept is re-elaborated by Page and Czuba (1999) who define empowerment as *a multi-dimensional social process that helps people gain control over their own lives*, an important implication of this definition is that the individual and community are fundamental connected and empowerment depends upon the possibilities to expand and change this 'power'. Gutierrez (1990) defines empowerment as *a process of increasing personal, interpersonal, or political power so that individuals can take action to improve their life situations* (page 149). Empowerment is thus connected at collective level to political and objective changes, and at the individual level, to personal changes (Itzhaky & York, 2000).

Finally, the comprehensive definition given by Segal et al. (1993) considers empowerment as a process of gaining control over one's life and influencing the organizational and societal structure in which one lives.

### ***Empowerment across disciplines***

Empowerment as a multidimensional concept is analysed in various disciplines, psychology and healthcare, politics, and management. A vast literature exists for healthcare and psychotherapy where the term empowerment was firstly used in the sixties in studies related to psychology communities. In this field a relevant aspect of empowerment is self-determination as a result of information access and knowledge to be able to make informed choices (Geller et al., 1998; Wowra et al., 1999). Empowerment here implies an adequate relationship between professionals and patients, based on shared responsibilities, common objectives, and values.

It is in the political and minority rights context that empowerment is related to the protection of most vulnerable citizens, thus also consumers. In particular the idea of empowerment is connected to the movements for human rights and marginalized group, access to information for citizens' choices, greater sharing of responsibility, and local organizational capacity. Following Longwe (1991), five different degrees of increased empowerment can be identified, from *welfare*, which implies only the satisfaction of basic needs, to *control degree*, where individuals fully participate to the making decisions process. An increased participation of previously excluded groups is also advocated by Luttrell et al. (2009).

This literature also emphasizes the tight connection between empowerment and education. Education is a prerequisite for empowerment and a source of empowerment in itself. On the other hand education is a dimension of consumer empowerment, as it is necessary to correctly understand and use an increasing flow of information (Hunter, Harrison and Waite, 2006; Cutler and Nye, 2000). More recently, empowerment started appearing in management and organisational literature, where it is related to keywords such as management strategy, techniques implementation and empowering teams, employees' participation, and shared authority (Bowen & Lawler III, 1995; Spreitzer, Kizilos & Nason, 1997, Lincoln et al., 2002). Peterson and Zimmerman (2004) recognise empowerment as a multilevel concept, involving individuals, communities, and organizations, and propose three components for organizational empowerment: intraorganizational, interorganizational, and extraorganizational. Finally an interesting aspect of this literature developed by Conger and Kanungo (1988) is the positive relationship between the identification and removal of vulnerability conditions and the role of information.

## 5. Income

The question chosen to represent the income of the respondent was QA51: A household may have different sources of income and more than one household member may contribute to it. Thinking of your household's total income, is your household able to make ends meet (namely, to pay for its usual necessary expenses)....?

QA51: answer categories: *with great difficulty* and *with difficulties* (sample: 9993)

## 6. Language spoken

The question chosen to represent the intra-EU migrant status is QA49: Is your mother tongue different from the official language(s) spoken in (OUR COUNTRY)?

We are aware that this question does not fully account for the migrant status, as (i) only EU citizens are interviewed, and (ii) there are migrants whose mother tongue does not differ from the official language (such as e.g. French or Dutch migrants in Belgium).

QA49: answer No (sample: 4891)

## 8. Perception of empowerment

The question used is QA48: In general, when choosing and buying goods and services, how (1) Confident do you feel as a consumer?; (2) Knowledgeable do you feel as a consumer?; (3) Well protected by consumer law do you feel? We chose to represent the extremes of the sample distribution and to extract only the sample of respondents answering they feel very or quite confident, knowledgeable and protected and those who feel they are not very or not at all confident, knowledgeable and protected.

QA48: Feel very or quite confident, knowledgeable and protected (sample: 24296)

**Abstract**

The 2007-2013 EU Consumer Policy Strategy emphasizes the importance of a better understanding of how consumers behave and sets as a main objective “to empower EU consumers”. A thorough knowledge of the capacities, information and assertiveness of consumers is considered crucial for being able to design and develop policies for consumer protection. Using the special Eurobarometer Survey n. 342, the DG Joint Research Center (together with DG Health and Consumers) constructed a composite measure of consumer empowerment encompassing the plurality of aspects implied by the EU policy Strategy. The resulting Consumer Empowerment Index describes consumer empowerment along three main dimensions: Consumer skills, Awareness of consumer legislation and Consumer engagement. The Index covers all 27 European countries plus Iceland and Norway. This report illustrates the different steps on the construction of the Index: the quantification of survey questions, the univariate and multivariate analysis of the dataset, the definition of an operational framework as well the selection of weights. Robustness analysis against alternative methodological choices is included. The relationship between socio economic characteristics of respondents and their level of empowerment is also presented with the aim of characterising the most crucial socio-economic determinants of empowerment and foster the debate on consumer protection.

### **How to obtain EU publications**

Our priced publications are available from EU Bookshop (<http://bookshop.europa.eu>), where you can place an order with the sales agent of your choice.

The Publications Office has a worldwide network of sales agents. You can obtain their contact details by sending a fax to (352) 29 29-42758.

The mission of the JRC is to provide customer-driven scientific and technical support for the conception, development, implementation and monitoring of EU policies. As a service of the European Commission, the JRC functions as a reference centre of science and technology for the Union. Close to the policy-making process, it serves the common interest of the Member States, while being independent of special interests, whether private or national.
