Estimation de l'emploi sectoriel par zone d'emploi du 31.12.1989
au 31.12.2010 – Compléments à la série 1998–2007 de l'INSEE

*Rodolphe BUDA,
Université de Paris 10*

7th July 2011

Résumé – *Dans ce papier, nous présentons la construction de séries longues d'emploi sectoriel par zone d'emploi français sur la période 1989–2010. Nous avons complété les séries 1998–2007, récemment publiées par l'INSEE. Nous décrivons la méthodologie utilisée et nous présentons les tableaux de résultats. Ce travail s'inscrit dans une projet de construction de séries plus longues de 1983 à nos jours. C'est pourquoi nous n'avons pas commenté nos séries.*

Mots-clés : Séries longues ; Rétropolation ; Emploi salarié ; Emploi non salarié ; Région ; Zone d'emploi ; Branche

Abstract – *This paper presents the building of long run data series about the French employment by employment area (zone d'emploi) from 1989 to 2010. We have completed the data series expressed by INSEE from 1998 to 2007. In the paper we describe our methodology and we present the results. This work is included inside a long run data series building project (1983–today). That's the reason why we don't provide any comment at this step.*

Keywords : Long Run Time Series ; Retropalation ; Salaried Employment ; Non Salaried Employment ; Region ; Employment Area ; Branche

JEL Classification : R58; C82; J21; C19; R23.

0 – Introduction

Ce papier présente la construction de séries d'emploi salarié et non salarié par secteur et par zone d'emploi. Nous y proposons une série de 1989 à 2010 en reprenant les séries de 1998 à 2007 publiées par l'INSEE [8]. Ce travail s'inscrit dans un projet plus général de constitution de séries longues d'emploi détaillé par niveau géographique (zone, département et région) et par secteur (et branche) [1, 2, 3, 6] destiné à proposer des analyses rétrospectives des politiques successives de l'emploi et déterminer le schéma d'évolution théorique le plus pertinent sur la période 1967 à nos jours.

Le zonage de l'activité économique a été proposé en 1983 – voir pour répondre à une lacune en termes de statistiques infra régionales [15]. Toutefois, le découpage par zone d'emploi, effectué à partir des espaces de migrations alternantes des salariés

Une zone d'emploi est un espace géographique à l'intérieur duquel la plupart des actifs résident et travaillent, et dans lequel les établissements peuvent trouver l'essentiel de la main d'œuvre nécessaire pour occuper les emplois offerts.

Le découpage en zones d'emploi constitue une partition du territoire adaptée aux études locales sur le marché du travail. Le zonage définit aussi des territoires pertinents pour les diagnostics locaux et peut guider la délimitation de territoires pour la mise en œuvre des politiques territoriales initiées par les pouvoirs publics ou les acteurs locaux. Ce zonage est défini à la fois pour la France métropolitaine et les DOM.

Le découpage actualisé se fonde sur les flux de déplacement domicile-travail des actifs observés lors du recensement de 2006. La liste des communes est celle donnée par le Code Officiel Géographique (COG) au 01/01/2010.

Source : http://www.insee.fr/fr/methodes/default.asp?page=zonages/zones_emploi.htm.

n'est malheureusement pas stable à long terme.

Un premier découpage en 365 zones a été proposé – circulaire du 23 septembre 1982 –, remis en question en 1994 par un second découpage en 348 zones puis en 2010 par un troisième en 322 zones¹.

Notre travail a consisté à compléter les séries du second découpage sur la période complète 1994–2010². Nous présenterons dans un premier temps la méthodologie de construction des séries puis nous livrerons les tableaux de résultats. Les commentaires des séries feront l'objet d'un document de travail ultérieur.

1 – Méthodologie

L'INSEE a diffusé une série d'emploi par zone d'emploi déclinée en cinq secteurs salarié (agriculture, industrie, construction, tertiaire marchand et tertiaire non marchand) et l'emploi non salarié total, sur la période 1998–2007 (au 31 décembre) [8]. Nous avons complété les séries initiales de l'INSEE [8] en commençant nos séries dès 1989 (en référence au données du recensement de population de 1990) et en prolongeant les séries pour les années 2008, 2009 et 2010; un nouveau découpage entrant en vigueur pour les données 2011. Notre travail a été effectué en deux étapes principales. La première a consisté à estimer l'emploi sectoriel par zone sur la période 1989³–1997 en utilisant deux sources d'information et en les réconciliant par un RAS. Puis la seconde étape a consisté à estimer l'emploi sectoriel par zone en 2008, 2009 puis en 2010, à partir d'ajustements économétriques et de rééquilibrages RAS [16]. Précisons que ce travail a été effectué à l'aide du logiciel⁴ SIMUL 3.2 [4, 5].

1.1 – Estimation des données sur la période 1989–1997

Notre estimation s'est appuyée sur les données d'emploi total par zone et en quatre secteurs (agriculture, industrie, construction et tertiaire) issues du recensement 1990 [7] et sur l'année 1998 de la série

1. Ces découpages ont été le fruit de l'exploitation des recensements de population de 1982, 1990 et 2006.

2. Nous avons en fait rétropolé cinq ans en arrière au 31.12.89.

3. Nous avons fait débuter la série en 1989 du fait que les données du recensement 1990 sont observées au 31 décembre 1989. Nous avons conservé le découpage sectoriel de la série 1998–2007.

4. Conformément aux recommandations d'exigence de "replication" des traitements statistiques prônées récemment [17, 18].

d'emploi par zone de l'INSEE [8]. L'estimation de l'année 1989 a nécessité de passer du découpage en quatre secteurs au découpage en cinq secteurs salariés + non salarié total. A cette occasion, nous avons utilisé les données détaillées départementales [9] puis appliqué les proportions départementales aux zones correspondantes. Nous avons ensuite rééquilibré le tableau 6x348 à l'aide d'un RAS, sur les marges par zone et les marges sectorielles.

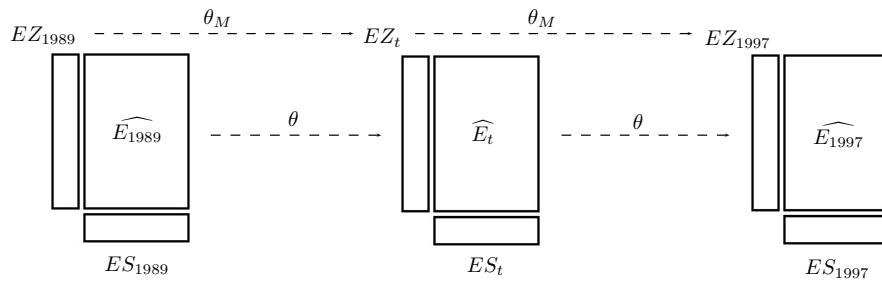

Fig. 1 – Estimation 1989–1997 par progression géométrique et RAS

L'estimation des années 1990 à 1997 a été obtenue en calculant le taux d'évolution entre 1989 et 1998 puis en calculant la moyenne géométrique. Ce taux a été ensuite appliqué aux données de chaque année pour obtenir celles de l'année suivante jusqu'en 1997. Le total par zone des années 1990 à 1997 a également été obtenu par application d'une moyenne géométrique afin d'estimer les marges par zone sur cette période. Il a ensuite été possible de rééquilibrer les tableaux 1990 à 1997 sur les marges par zone (estimées) et les marges par secteur disponibles dans les données départementales [9].

1.2 – Estimation des données des années 2008, 2009 et 2010

Les données de l'année 2008 ont été obtenues à partir d'un rééquilibrage RAS des données de l'année 2007 [8] sur les marges par secteur 2008 (disponibles) et sur les marges par zone d'emploi 2008 (estimées). Les marges par zone d'emploi ont été estimées économétriquement à partir de l'emploi régional [9]. Nous n'avons pas fait l'hypothèse que les proportions des zones d'emploi au sein de chaque région de 2008 étaient les mêmes qu'en 2007.

Les données de l'année 2009 ont été obtenues à partir d'un rééquilibrage RAS des données de l'année 2008 (précédemment estimées) sur les marges par secteur 2009 [13] et sur les marges par zone d'emploi 2009 (estimées). Celles-ci ont été estimées économétriquement à partir de l'emploi régional (estimé) avec l'hypothèse de constance des proportions de zones d'emploi au sein de chaque région entre 2008 et 2009. Nous avons enfin estimé l'emploi régional 2009 à partir de l'emploi total [13] et de données démographiques régionales (population régionale⁵, emploi total) [11, 12].

Les données de l'année 2010 ont également été estimées à partir d'un RAS. L'emploi sectoriel pour l'année 2010 était disponible uniquement pour le secteur marchand [14]. Nous avons donc estimé les marges sectorielles – voir Fig.2 – à partir de plusieurs jeux d'équations (emploi du secteur concurrentiel)⁶.

5. La population régionale 2010 a été obtenue en appliquant la répartition régionale au 1er janvier 2010 au chiffre national de la population au 1er janvier 2011.

6. L'estimation de l'emploi total par les indicateurs de retournement et les indicateurs synthétiques s'est révélée médiocre [10].

Fig. 2 – Estimation des marges pour l'année 2010

Les marges par zone d'emploi ont été estimées économétriquement à partir de l'emploi régional [9] – sous l'hypothèse de constance de la proportion des zones au sein des régions. Nous avons estimé l'emploi régional 2010 à partir de l'emploi total et de données démographiques régionales (population régionale, emploi total) [11, 12, 14].

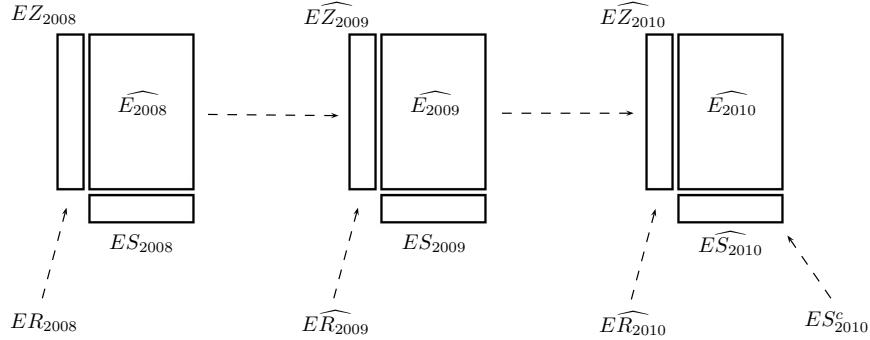

Fig. 3 – Estimation économique+RAS 2008, 2009 et 2010

2 – Présentation des résultats

Les tableaux présentés ci-après fournissent les effectifs par secteur (Agriculture, Industrie, Construction, Tertiaire marchand, Tertiaire non marchand, Emploi non salarié, Emploi salarié total et Emploi total) par zone d'emploi. Chaque tableau présente l'évolution par année. L'identification des zones d'emploi est fournie par le code et par les cinq premières lettres de l'intitulé de la zone. Les effectifs de l'agriculture et de la construction sont fournis à l'unité près, bien que la précision ne puisse être garantie à ce niveau⁷. Les effectifs des autres secteurs sont fournis en milliers. Le commentaire relatif à ces séries fera l'objet d'un document de travail ultérieur.

7. Nous n'avons pas présenté ces chiffres en milliers afin de faire apparaître les effectifs non nuls mais inférieurs à 100.

3 – Conclusion

Nous avons présenté dans ce papier, la construction de nos séries d'emploi 1989–2010, par zone d'emploi en France, destinées à compléter celles de l'INSEE (1998–2007).

Nous n'avons pas proposé ici de commentaire de nos séries. En effet, ce travail est une première étape à la construction de séries plus longues d'emploi par zone d'emploi. Il s'agira pour nous d'estimer l'emploi par zone de la période 1983 à nos jours en tenant compte de la difficulté des changements de zonage.

Plus généralement, ce travail s'inscrit dans un projet de constitution de séries longues détaillées (locales, sectorielles) de données du marché du travail français. Notre objectif consiste à proposer des séries permettant une analyse rétrospective fine (locale, sectorielle) des politiques de l'emploi en France et également de proposer l'identification d'un (ou de) schéma(s) théorique(s) pertinent(s) sur la période 1967 à nos jours.
