Abstract

Various theories ascertain that there is a positive relationship between inflation and interest rate. Developed and developing economies are still in search of an optimum inflation rate that increases economic growth. The SACU members has recorded low growths levels over the past years coupled with low inflation rates. This study examines the relationship between inflation rate, interest rate and economic growth in Southern African Customs Union (SACU) countries. Panel data for SACU countries covering the period 1991 to 2018 was analysed using Pooled Mean Group (PMG) estimators which are Panel Autoregressive Distributed Lag (ARDL) model, Fully Modified Ordinary Least Squares (FMOLS) and Dynamic Ordinary Least Squares (DOLS) to enable isolating short and long run effects and for robustness. The results of the study show that inflation has a positive impact on economic growth while lending rate has a negative impact on growth in the long run. These results imply that policymakers should allow a high sustainable inflation rate in order to promote economic growth while interest rate can be used as a monetary policy instrument to achieve the desired inflation rate that will affect economic growth positively.

Keywords: Inflation, Interest rate, Economic growth, Southern African Customs Union
1. Introduction and Background

Maintaining price stability is essential for achieving economic growth. This is achieved through monitoring inflation rate and maintaining a low and stable rate through the use of monetary policy instruments such as interest rate. Central banks have a mandate to attain price stability together with other macroeconomic objectives such as economic growth and high employment (Southern African Customs Union, 2013). In some instances, however, central banks can have the dual mandate of attaining price stability and achieving set level of economic growth or employment, among other alternatives (Bhattacharyya, 2012). The debate on which approach is the best rages on across the world. Developed and developing economies are still in search of an optimum inflation rate that increases economic growth. This study seeks to take this debate further, focusing on a group of countries with customs agreement and largely aligned macroeconomic policies, the Southern African Customs Union (SACU).

The geographic proximity of the SACU members and the alignment at large of macroeconomic policies such as monetary and exchange rate policies and international trade and investment linkages makes the group a befitting natural experiment to draw the debate to some logical conclusion. The SACU region recorded an average growth of 1.3% in 2017 compared to 0.8% in 2016 and in 2019, the highest projected growth rate of 3.8% was recorded in Botswana, with the lowest growth rate of 1.7% recorded in South Africa and Swaziland (African Development Bank Group, 2019; Southern African Customs Union, 2018). Compared to inflation rates during the same period, inflation has been on a downward trajectory in the SACU region (Southern African Customs Union, 2018). It appears that attainment of price stability is possible and necessary, however it is not sufficient for economic growth. According to the World Bank Group (2018), gross domestic product (GDP) growth in the SACU region decelerated in 2016 and 2017 and recovery is not expected to be strong enough especially in South Africa. South Africa with the inflation targeting monetary policy has maintained inflation rate between 3%-6% and interest rate is maintained at 6.75% but gross domestic product growth rates and employment levels plummeted. It becomes an issue of concern as to why maintaining very low inflation, sacrificing growth. This arose the interest on examining the relationship between inflation rate and economic growth in SACU region since theoretical literature is not convincing and interest rate is one to the instruments used by central banks in controlling inflation to achieve growth.
From a theoretical point of view, different perspective exists regarding the relationship between inflation and economic growth. For instance, while the monetarists view pioneered by Milton Friedman (1967) posit that inflation is harmful to growth in the long-run, the structuralists argue that inflation enhances economic growth. Tobin (1965) support this argument, asserting that money is a substitute for capital and inflation raises the opportunity cost of holding money, thereby increasing capital accumulation and economic growth. Stockman (1981) considers money to be complementary to capital, thereby causing inflation to have a negative impact on economic growth, an outcome known as the anti-Tobin effect. Contrary to all these theories, Sidrauski (1967) established that money is neutral and super-neutral, causing inflation to have no impact on economic growth. These different perspectives regarding the relationship between inflation and economic growth shows that low inflation levels may be or may not be growth sacrificing.

Due to the adverse outcomes of high inflation levels on macroeconomic stability, some central banks such as the South African Reserve Bank (SARB) in 2000 and Bank of Ghana (BOG) in 2002 adopted inflation targeting framework, maintaining low inflation levels (Mavikela et al., 2019). The popularity of inflation targeting framework arose following the 1997-1998 Asian financial crisis and the International Monetary Fund’s advocacy for Central Banks to combine both flexible exchange rate regime and inflation targeting policy (Phiri, 2012). Inflation targeting framework appears to be popular in industrialised countries considering that only two Central Banks in African countries, the SARB and BOG adopted the fully-fledged inflation targeting framework (Mavikela et al., 2019). However, whether inflation targeting is a desirable option to achieve growth is worth investigating. According to the World Bank Group (2018), the general economic downturn in SACU region and contraction of per capital income in Namibia and South Africa contributed to increase in poverty in the region. The desirability of maintaining low inflation to achieve favourable economic growth is worth exploring given low economic growth and very low inflation levels being experienced by SACU countries. Figure 1 below shows that while GDP growth rates in SACU countries have been falling over the period 2010 to 2018, there is no much variation in inflation rates among these countries with Botswana being the only country having inflation rate which is much different from other countries. This might be because all other SACU members currency are pegged at par with the rand except the Pula of Botswana. Changes in the South African inflation rate is likely to have spillover to the Common Monetary Area members.
The low economic growth rates and high inflation rates that have been reported in many developing countries following the global financial crisis. This raised many concerns that has caused many researchers to estimate the relationship between economic growth and inflation rate. In the context of SACU region, no country had inflation rate more than 9% between 2010 and 2018 but growth of GDP has been falling. This has motivated us to investigate the relationship between the growth of GDP and inflation rate in the SACU region so as to determine if increasing inflation will stimulate growth. Incorporating interest rate for it is a monetary instrument used to influence inflation. In this study, we make use of the Pooled Mean Group (PMG) estimators to examine the relationship between inflation, interest rate and economic growth in the SACU region.

2. Theoretical and Empirical Literature Review

Various theories exist in trying to explain the relationship between inflation, interest rate and economic growth and among these include the Monetarist Theory pioneered by Milton Friedman (1967). The theory posits that increasing money supply at a faster rate than the growth in the economy result in inflation, which is harmful to economic growth. In an attempt to influence inflation and economic growth, interest rate control can be used, where there is a change in the short-term interest rate by the Central Bank (Bain and Howells, 2003). However,
the impact of monetary policy changes is not direct and affect through different channels. Expansionary monetary policy leads to a decrease in real interest rates and investment spending will increase, leading to an increase in aggregate demand. The rise in aggregate demand lead to increase in price level economy output. This implies a negative relationship between interest rate and economic growth and a negative relationship between interest rate and inflation.

The classical theory by Adam Smith (1776) and developed by Ricardo (1817) assumes that an economy always attains full employment through the invisible hand, allowing flexibility in prices, wages and other input prices. The full employment assumption shows that an increase in Aggregate Demand (AD) following monetary policy changes do not have an impact on the level of output but result in inflation, hence inflation and output growth are not correlated. However, the Keynesian theory by Keynes (1936) assumes a positive relationship between inflation and economic growth in the short run only. The theory is centred upon the AD and Aggregate Supply (AS) framework and in the short run, inflation and output are not correlated due to stickiness of wages and prices. In the long run, inflation and output are not related due to full employment while in the intermediate phase, inflation and output are positively related due to flexibility of prices and wages.

In support of the theoretical relationship, empirical studies have been reviewed to observe this relationship in various countries and mixed findings were obtained as well. The Table 1 below summarises the studies of Harswari and Hamza (2017), Karahan and Yilgor (2017), Stawaska (2016), Sattarov (2011), Thanh (2015), Pradhan, Arvin and Bahmani (2015) and Holston et al. (2017) for developed countries. All these studies examined the relationship between inflation, interest rate and economic growth with the exception of Sattarov (2011) and Thanh (2015) who examined the relationship and the threshold level of inflation for economic growth.

</table>

Note: GDP = Gross Domestic Product, FDI = Foreign Direct Investment, INF = Inflation rate, EXCH = Exchange rate, IR = Interest Rate, CPI = Consumer Price Index, OLS = Ordinary Least Squares, VAR = Vector Autoregression, PSTR = Panel Smooth Transition Regression, PVAR = Panel Vector Autoregression.
As shown in the table above, Harswari and Hamza (2017) and Stawska (2016) used Ordinary Least Squares estimation technique to investigate the relationship while Karahan and Yilgor (2017) and Sattarov (2011) used Vector Autoregressive model. The rest of the studies used different techniques to analyse the relationship. Harswari and Hamza (2017) and Holston et al. (2017) found a negative relationship between interest rate and economic growth while Karahan and Yilgor (2017) found a positive relationship between inflation and interest rate. The rest of the studies found a positive relationship between inflation and economic growth, with Sattarov (2011) and Thanh (2015) showing a threshold level of inflation for economic growth where this relationship change.

In developing countries, several studies have been done on the relationship between inflation, interest rate and economic growth. Examples include studies by Akume et al. (2016), Seleteng et al. (2013), Havi and Enu (2014), Denbel et al. (2016), Ayres et al. (2014), Agbaba (2018), Imleesh et al. (2017), Mallick and Sousa (2013), Eggoh and Khan (2014) and Kasidi and Mwakanemela (2013).

Table 2 shows that Seleteng et al. (2013), Imleesh et al. (2017) and Eggoh and Khan (2014) used the Panel Smooth Transition Regression (PSTR) method. However, Njimanted et al. (2016), Denbel et al. (2016) and Mallick and Sousa (2013) used the VAR methodology while the rest of the studies used different methodologies to infer the relationship between inflation, interest rate and economic growth.

Njimanted et al. (2016), Havi and Enu (2014), Denbel et al. (2016), Agbaba (2018), Eggoh and Khan (2014) and Kasidi and Mwakanemela (2013) shows a negative relationship between inflation and economic growth, while Ayres et al. (2014) and Imleesh et al. (2017) found a positive relationship between inflation and interest rate. In addition, Imleesh et al. (2017) found a positive relationship between interest rate and economic growth while Seleteng et al. (2013) found a non-linear relationship between inflation and economic growth.

</tbody>
</table>

As shown in table 3, 50% of the studies used the OLS estimation technique with the rest of the studies using different methodologies. All of the studies above assert that there is a relationship between inflation, interest rate and economic growth with Vermeulen (2015) showing a negative relationship between inflation and output.

From the reviewed studies, it can be concluded that developed countries show a positive relationship between inflation and economic growth with the developing countries showing a negative relationship. This inconsistence entices the need to examine the relationship between inflation rate, interest rate and economic growth in the SACU region. To the best of our knowledge there are few studies done to investigates the relationship between economic growth, inflation and interest rate in SACU region.

3. Data Sources and Methodology

3.1 Data Sources

The data for SACU countries is obtained for a period between 1991-2018. Interest rate used shows the bank rate that usually meets the short- and medium-term financing needs of the private sector. The data sources are shown in table 4 below.

3.2 Methodology

The study uses a log-log model and the functional form shown below:

\[
\log \Delta GDP_{it} = \beta_1 + \beta_2 \log \Delta CPI_{it} + \beta_3 \log \Delta I_{it} + \mu_{it} \quad i = 1,2, \ldots \ldots N, t \\
= 1,2, \ldots \ldots T. 
\] (1)

Where $\Delta$ GDP is changes in Gross domestic product for country $i$ in period $t$, $\Delta$ CPI is the changes in Consumer Price Index, which shows inflation rate for country $i$ in period $t$, $\Delta I$ is the changes in interest rate for country $i$ in period $t$, $i$ is the individual country and $t$ is time.
period. The estimation method used in this study is the Panel ARDL model, FMOL and the DOLS. According to Nkoro and Uko (2016), these PMG models allows for heterogeneity only in the short-run compared to the mean group which allows for heterogeneity both in the short and the long-run. Besides the short-run and long-run effects that are captured among the variables in the model, the PMG additionally investigates the dynamic effects of the independent variables on the dependent variable. The general form of the PMG can be shown by the following equation:

\[
GD_{Pt} = \sum_{j=1}^{p} \lambda_{ij} \Delta GDP_{t-j} + \sum_{j=0}^{q} \delta_{ij} \Delta CPI_{t-j} + \sum_{j=0}^{q} \delta_{ij} \Delta I_{t-j} + \mu_t + \epsilon_{it} \tag{2}
\]

The following notation for equation (2):

- \(i\) number of panels countries with \(i = 1, 2, \ldots, 5\)
- \(t\) = time period with \(t = 1, 2, \ldots, 12\)
- \(\lambda_{ij}\) = is a scalar
- \(\mu_t\) = is a group specific effect.

The error correction equation is derived from equation (2):

\[
\Delta GDP_{it} = \phi_i (GDP_{it-1} - \beta_{1i} - \beta_{2i} CPI_{it} - \beta_{3i} I_{it}) + \sum_{j=1}^{p} \lambda_{ij} \Delta GDP_{t-j} + \sum_{j=0}^{q} \delta_{1i,j} \Delta CPI_{t-j} + \sum_{j=0}^{q} \delta_{2i,j} \Delta I_{t-j} + u_{it} \tag{3}
\]

With \(\Delta\) indicating first difference operator, \(\lambda_{ij} = -\sum_{m=j+1}^{p} \lambda_{i,m}. \delta_{i,j} = -\sum_{m=j+1}^{q} \delta_{i,m}\), and \(\phi_i = -(1 - \sum_{j=1}^{p} \lambda_{i,j})\) is the error correction term which measures the speed of adjustment back to the steady state equilibrium subsequent to a shock to the system and the parameter is expected to be negative and significant. If the speed of adjustment is statistically not different from zero, then no long-run relationship exit.

4. Empirical Analysis and Results

4.1 SACU Countries Comparative Analysis for the period 1991-2018

The movements of economic growth, inflation and interest rate are shown in figure 2, figure 3 and figure 4 below, respectively.
Figure 2: GDP growth rate for countries in the SACU region

Figure 3: Inflation rates of countries in the SACU region

While economic growth shows a positive fluctuating trend for South Africa and Eswatini and no specific trend for other countries over the study period, inflation shows a downward fluctuating trend for all the five countries. In addition, interest rates have been falling on average for all the countries over the study period.

4.2 The Panel Results

The relationship between inflation, lending rates and economic growth is examined using the Panel ARDL model, FMOL and the DOLS to enable isolating short and long run effects. The FMOL and DOLS takes care of small sample bias and endogeneity bias.

4.2.1 The Panel Unit root test

The study uses the common root (Levin, Lin, & Chu) and individual root (Lm, Pesaran and Shin). The summary of the SACU panel unit root tests is shown in the table below.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Levin, Lin, &amp; Ch Level</th>
<th>Levin, Lin, &amp; Ch 1st Difference</th>
<th>Lm, Pesaran and Shin W-sta Levels</th>
<th>Lm, Pesaran and Shin W-sta 1st Difference</th>
</tr>
</thead>
</table>

Source: Author’s calculation from Eviews 9.2 using data from World Bank (2020)
The above table shows that the GDP is integrated in order 1 whilst the CPI and the lending rates is stationary in levels. Since GDP is $I(1)$ while CPI and the lending rates are $I(0)$ and none is $I(2)$, we can develop a panel ARDL model.

4.2.3 Panel ARDL Results for SACU Members

In table 6, the panel cointegration test was performed using Pedroni and Kao cointegration test. In the Pedroni Cointegration Test, Panel v-Statistic, Panel rho-Statistic, Panel PP-Statistic and Panel ADF-Statistic were used while for Kao cointegration test, we used the ADF t-statistic test. A summary of all these results are shown in the table below. Table 7 and Table 8 shows the short run and long results from our analysis, respectively.
The Panel ARDL results shows that changes in CPI values has a positive effect on changes in GDP in the long run whereas changes in lending rates has negative effect on changes in GDP values in the long run. The Panel ARDL shows that CPI and lending rates have no impact on GDP in the short run. These results shows that in the long run, when SACU CPI increases by 1%, on average, the SACU’s GDP increases by 0.90%. In contrast, an increase in SACU lending rates by 1% lead to a decline in SACU GDP by 0.22% on average, in the long run.

Although, the Panel ARDL is used to guide in the conclusion, the FMOLS and the DOLS results also shows a significant positive relationship between CPI and GDP while no relationship between lending rates and the GDP is found in SACU. According to the FMOLS, an increase in the CPI by 1% increases the GDP by 0.63 on average. The DOLS results shows that if the CPI increases by 1%, the GDP increases by 0.57%, on average.

The positive relationship between inflation and economic growth is in line with the economic theories. Blanchard and Kiyotaki (1987) believes that the positive relationship can be due to agreements by some firms to supply goods at a later date at an agreed price. Therefore, even if the prices of goods in the economy have increased, output would not decline, as the producer has to fulfil the demand of the consumer with whom the agreement was made. The aggregate supply-aggregate demand (AS-AD) framework also postulates a positive relationship between inflation and growth whereas growth increases, so does the inflation. This evidence is also available in SACU countries where for the past two to three years, inflation has been low and economic growth as well was very low, showing a positive relationship. The works of Stawska (2016), Sattarov (2011) and Pradhan et al, (2015) also shows a positive relationship between economic growth and inflation. The findings shows that an increase in the inflation rate may results in an increase in the economic growth of the SACU countries. These results shows that any inflationary trend in the SACU region has a positive a positive impact to the growth of their economies.
5. Conclusion and Policy Implications

The objective of this study was to examine the short-run and long-run relationship between inflation, interest rate and economic growth in the SACU region over the period 1991-2018. Some variables were found to be stationary while others were found to be integrated of order one, hence the panel ARDL model and co-integrating regressions (FMOLS and DOLS) were used to examine this relationship. The results of the Panel ARDL shows that inflation has a positive impact on growth only in the long run while lending rate has a negative impact on growth only in the long run. The FMOLS and DOLS results also show a positive relationship between inflation and economic growth and no relationship between lending rate and GDP is found in SACU region. Despite having some slight differences in terms of the findings, the models agree that inflation has a positive impact on economic growth while interest rate has no impact on economic growth.

These findings provide some important policy implications. The analysis shows that it is desirable to keep inflation high, *ceteris paribus*, and therefore Central Bank should implement those policies that promote inflation maintained at a higher desirable level so as to achieve robust economic growth. Since lending rate is found to have no impact on economic growth in the SACU region, the interest rate can be increased or decreased to manipulate inflation to achieve growth. However, it should be noted that inflation is desirable for growth up to a certain level, where beyond that level, higher inflation is harmful to growth and this level of inflation was beyond the scope of this study. Thus, while inflation targeting brings sanity within the financial sector, this might retards growth as the desirable inflation level would be beyond the targeted inflation level.
