Abstract

This paper seeks to explore the effects of ASEAN Economic Community (AEC) Blueprint adoption since 20 November 2007 on the bilateral manufacturing trade between the ASEAN member countries and their trading partners. Ten ASEAN member countries and their 39 trading partners are considered in this study. A panel with model with AEC dummy variables is estimated on a set of panel data over the sample period of 1995 to 2014. Overall, it is found that AEC has created substantial trade creation effects for the exports of tobacco & manufactured tobacco substitutes, and limestone materials for manufacture of lime. On the other hand, there are substantial trade diversion effects for the exports of the fur-skins & artificial fur manufactures, manufactures of plaiting material & basketwork, miscellaneous manufactured articles, as well as the machines & apparatus.

Introduction

On 20 November, 2007, ASEAN Economic Community (AEC) blueprint was adopted with the aim to create a single market across ASEAN nations. Generally, AEC is meant to be a single market and production base with the free movement of products, services, investments, trained workforce and freer flow of capital, which will make the association more dynamic and competitive with recent approaches and measures in strengthening the achievement of its existing economic schemes; progressing the regional integration in the priority segments; simplifying the movements of trained workforce, business groups and endowments; and pointing out the standard procedures of ASEAN countries. Ultimately,

¹ To cite this Article: Wong, C. K. K., Liew, V.K.-S., & Arip, M. A. (2020). The Effects of ASEAN Economic Community (AEC) Blueprint Adoption on Intra-ASEAN Trade on Manufacturing Products. *International Journal of Academic Research in Business and Social Sciences*, 10(2), 680 – 690.

AEC is meant to sustain the balanced economic growth within the region as well as to reduce poverty and socio-economic dissimilarities by 2020.

The ASEAN leaders had agreed to accelerate the adjustment for eight priority goods sectors² together with four service segments³ in their Summit during 2003 as one of the significant portions to accomplish the identified objective. Generally, each of these priority sectors holds a roadmap that brings together the specific measures of the segment with all-inclusive outlines which are the additions to the whole of its primary segments, such as the trade facilitation measures. Through acquiring the capability of these major segments, this might facilitate ASEAN to be more dependent without the value-added financial measure together with the employment within the region.

In addition, the ASEAN leaders had adopted the ASEAN Economic Community Blueprint at the 13th ASEAN Summit, on 20 November 2007 in Singapore, to serve as a comprehensible master plan that drives the formation of the ASEAN Economic Community in 2020⁴. Generally, the AEC foresees the following key elements: (a) a single market and production base, (b) a highly competitive economic region, (c) a region of unbiased economic development, and (d) a region effusively integrated into the international economy.

The AEC agreement not only focuses on the tariff reductions on substantial product groups; however, it also focuses on the elimination of non-tariff barriers, quantitative margins as well as some other cross-border measures. In consequence of eliminating the tariff barriers between the ASEAN member countries, AEC would further develop the ASEAN economies into a single market and production base.

The prior study on AEC by Soesastro (2005) had shown the growth towards the development of the community by examining the trade trends within the ASEAN countries. Nevertheless, the important roles of the selected priority sectors in stimulating the ASEAN trade should also be observed. Secondly, Soesastro (2005) discussed the key model of AEC. It observed the major fundamentals of a broader and deeper economic integration method for ASEAN, which comprised the ultimate form of integration, and the appropriate method to achieve it in combination with the obligation for institutional growth to implement it. On the other hand, this study aims to observe the impact of AEC on bilateral aggregate and manufacturing trade between ASEAN member countries.

²Agro-based products, fisheries, healthcare products, rubber-based products, wood-based products, textiles and garments, electronics and information and communication technology (ICT), and automotive.

³e-ASEAN, healthcare, air travel and tourism.

⁴The implementation date was brought forward from original 2020 to 31 December 2015.

Literature Review

Oh and Sardar (2013) found that trade patterns are consistent with the gravity model estimation. They also found that the exports of Bangladesh are significantly reliant on the US market, by comparing the predicted and actual trade volumes of Bangladesh. In addition, Rasoulinezhad and Kang (2016) concluded that the gravity equation fits well on the data and thus established the presence of long-term relationships between bilateral trade flows and primary components⁵ of gravity model. They found that the trade flows of South Korea-Organization of the Petroleum Exporting Countries (OPEC) are well explained by the factors that impacted the energy security of South Korea such as the oil reserves, transportation costs as well as the political stability.

By investigating the major determining factors of bilateral trade flows, García et al. (2013) concluded that trade agreement had modest positive impact on the trade flows of MERCOSUR countries, namely Brazil, Argentina, Paraguay, and Uruguay. Likewise, Panda and Sethi (2015) observed that the trade flows of India was positive effected by the economic sizes of its trading partners and the dummy variable of common colonizer while it was negatively affected by the distance between two countries. They also discovered that per capita income had significant effects on trade flows for the pre-crisis period but bereaved its importance throughout the post-crisis period.

At the same time, Sultan and Munir (2015) reported that the determinants of export and import flows are different from the determinants of total trade. They also found that Pakistan had highest trade potential with Norway and Hungry; the highest export potential with Switzerland and Hungry, as well as the highest import potential with Norway, Philippines, Portugal and Greece.

Tumwebaze and Nahamya (2015) concluded that the export flows of Uganda were positively affected by GDPs, GDP per capita of its trading partners, differences in per capita GDP, real exchange rate, official common language, contiguity, as well as the establishment of Common Market for Eastern and Southern Africa (COMESA) and East African Community (EAC) while it were negatively affected by the Uganda's GDP per capita as well as the geographical distances between Uganda and its trading partners.

Eita (2016) concluded that the export flows were positively affected by the economic sizes of both exporting & importing countries and common border variables whereas the GDP per capita and real exchange rates of Namibia did not hold any substantial effects on the export volumes.

⁵GDP, income (GDP per capita), the difference in income, exchange rate, the openness level, distance and WTO membership

Methodology

In the present study, the panel model is employed in panel estimation from the period of 1995 to 2014 between ASEAN-10 member countries and its 39 trading partners, primarily the Asia countries and some developed and developing countries. Bilateral exports are presented in dollar terms (constant prices⁶) taken from the database of United Nation (2016). The GDP and the population data are acquired from World Bank (2016). Common language, common border, island or landlocked countries and distance measures are taken from Centre D'Etudes Prospectives Et D'Informations Internationales (CEPII, 2016).

This paper intends to attain the unbiased estimations for AEC dummy variable, specifically the trade creation or diversion effects within the trade-bloc (AEC_{1ijt}), trade creation or diversion effects for export or import between intra-bloc (AEC_{2ijt}) and extra-bloc countries (AEC_{3ijt}). Following the methods recommended by Baier and Bergstrand (2007), the panel data specification allows the study to control for both time-varying multilateral resistance terms as well as to keep away from the endogeneity bias of the gravity equation through introducing the country-and-time effects while retaining the country-pair fixed effects. The equation to be estimated is:

$$\ln X_{ijt} = \beta_0 + \phi_1 AEC_{1ijt} + \phi_2 AEC_{2ijt} + \phi_3 AEC_{3ijt} + \pi_{ij} + \epsilon_{it} + \psi_{jt} + \mu_{ijt}, \quad (1)$$

where,

X_{ijt} is total trade between countries i and j at time period t .

AEC_{1ijt} takes the value of 1 when countries i and j are members of AEC in year t , zero otherwise.

AEC_{2ijt} is a dummy variable that takes the value of 1 when country i is a member of the AEC and j is not in year t , zero otherwise.

AEC_{3ijt} takes the value of 1 when country i is non-AEC member and j is a member in year t , zero otherwise.

Generally, a positive coefficient implies that trade creation effects between the ASEAN member countries while negative coefficients indicate trade diversion effects (DeRosa, 2007).

⁶ The constant price is reflected as Export/US GDP Deflator.

Empirical Results

Six manufacturing products are considered in this study. They are:

- (1) Tobacco & manufactured tobacco substitutes,
- (2) Fur-skins & artificial fur, manufactures thereof,
- (3) Manufactures of plaiting material, basketwork, etc.,
- (4) Miscellaneous manufactured articles,
- (5) Limestone materials for manufacture of lime or cement, and
- (6) Machines & apparatus.

Equation 1 is estimated to analysis the effects of AEC agreements on various category of manufacturing products. The results are reported in Tables 1 and 2.

Panel data gravity estimations

From Table 1, it is observed from the results, for tobacco and manufactured tobacco substitutes as shown in Column (1), the coefficients of AEC_{1ijt} ($\theta_1 = -1.033$) and AEC_{2ijt} ($\theta_2 = -0.131$) are negative while the coefficient of AEC_{3ijt} ($\theta_3 = 1.499$) is positive and significant at 1% significance level. $\theta_1 < 0$ and $\theta_2 < 0$ means that AEC has generated the diversion as well as contraction of intra-bloc exports of tobacco & manufactured tobacco substitutes. Besides, $\theta_1 < 0$ and $\theta_3 > 0$ implies expansion of extra-bloc imports, albeit insignificant.

The results for fur-skins & artificial fur in Column (2) reported that the coefficients of AEC_{1ijt} ($\theta_1 = -0.883$) and AEC_{2ijt} ($\theta_2 = -0.418$) are reported as negative and statistically significant at 1% level while the coefficients of AEC_{3ijt} ($\theta_3 = 0.253$) is positive but statistically insignificant. $\theta_1 < 0$ indicates that AEC has generated trade diversion effects in terms of exports, while $\theta_2 < 0$ reveals the contraction of the intra-bloc manufacturing exports. Moreover $\theta_3 > 0$ indicates the expansion of the extra-bloc manufacturing imports.

Similar to the previous types of manufactured products, the coefficients of AEC_{1ijt} , and AEC_{2ijt} for manufactures of plaiting material & basketwork products are reported as negative and statistically significant ($\theta_1 = -1.107$ and $\theta_2 = -0.3625$). The positive coefficient of AEC_{3ijt} implies expansion of extra-bloc imports for manufactures of plaiting material & basketwork products.

In line with the results for miscellaneous manufactured articles in Column (4), the coefficients of AEC_{1ijt} , and AEC_{2ijt} are both negative and statistically significant. The negative coefficient of AEC_{1ijt} , $\theta_1 = -1.266$ indicates that AEC has created trade diversion effects. The coefficient of AEC_{2ijt} , $\theta_2 = -0.532$, which represents the lateral exports from the member countries of AEC to non-AEC member countries, shows a statistically significant negative coefficient, and thus indicates the contraction of the intra-bloc

manufacturing exports. Meanwhile, the coefficients of AEC_3_{ijt} , $\theta_3 = 0.884$ is positive and significant, which indicates the expansion of the extra-bloc manufacturing imports for miscellaneous manufactured articles.

Table 2 Panel data gravity estimations by using disaggregated exports with country-and-time and country-pair fixed effects

	(1) Tobacco & manufactured tobacco substitutes	(2) Fur-skins & artificial fur, manufactures thereof	(3) Manufactures of plaiting material, basketwork, etc.	(4) Miscellaneous manufactured articles	(5) Limestone materials for manufacture of lime or cement	(6) Machines & apparatus

Adj R -Squared	0.1441	0.2966	0.1782	0.1409	0.0422	0.2693
$RMSE$	4.4621	3.2981	3.0332	4.3717	1.7352	2.6318

Note: Robust and clustered standard errors applied in computing the t-values and t-values are reported below each of the coefficient. Estimation applies the estimator of White's heteroskedasticity-consistent covariance matrix. Data sources: Sectoral exports are extracted from UNCTAD database and are presented in thousand US\$. $AFTA_1$ takes the value of 1 when countries i and j are AFTA members in year t , zero otherwise. $AFTA_2$ takes the value of 1 when country i is a member of the AFTA and j is not in year t , zero otherwise. $AFTA_3$ takes the value of 1 when country i is non-member of AFTA and j is a member in year t , zero otherwise. AEC_1 takes the value of 1 when countries i and j are AEC members in year t , zero otherwise. AEC_2 takes the value of 1 when country i is a member of AEC and j is not in year t , zero otherwise. AEC_3 takes the value of 1 when country i is the non-member of AEC and j is a member in year t , zero otherwise. $ACFTA_1$ takes the value of 1 when countries i and j are the members of ACFTA in year t , zero otherwise. $ACFTA_2$ takes the value of 1 when country i is a member of ACFTA and j is not in year t , zero otherwise. $ACFTA_3$ takes the value of 1 when country i is non-member of ACFTA and j is a member in year t , zero otherwise. * $p < 10\%$ level of significance. ** $p < 5\%$ level of significance. *** $p < 1\%$ level of significance.

The coefficients of AEC_{1ijt} and AEC_{2ijt} for limestone materials for manufacture of lime or cement category are reported to be negative ($\theta_1 = -0.321$, $\theta_2 = -0.094$). In view of that, an overall trade diversion effects due to the AEC implementation in terms of exports and imports for limestone materials for manufacture of lime or cement category are identified for the coefficients of AEC_{1ijt} and AEC_{2ijt} . Meanwhile, the positive coefficient of AEC_{3ijt} indicates the expansion of the extra-bloc manufacturing imports for limestone materials for manufacture of lime or cement.

The coefficients of AEC_{1ijt} , AEC_{2ijt} and AEC_{3ijt} (-1.308, -1.386, -1.338 respectively) are reported as negative and statistically significant. The negative coefficients of AEC_{1ijt} and AEC_{2ijt} reflects export diversion and export contraction effects of AEC agreement on machines & apparatus category. Also, negative coefficient of AEC_{1ijt} , along with negative the coefficients of AEC_{3ijt} , indicates the imports diversion and import contraction for this category of manufactured products. Thus, an overall trade diversion and trade contraction effects in terms of both exports and imports due to the AEC implementation are identified in this model for machines & apparatus category.

Total trade creation & diversion effects

The negative coefficient of AEC_{1ijt} ($\theta_1 = -0.543$) indicates that AEC has created trade diversion effects. Meanwhile, the positive coefficient of AEC_{3ijt} ($\theta_3 = 0.988$) implies that non-AEC countries significantly increased their exports to member countries, compared to normal trade levels. On the whole, the significantly positive results established that reduction and exclusion of tariff barriers in AEC stimulates the overall trade volumes between intra-bloc member countries, as well as between the intra-bloc countries and extra-bloc countries. Overall, the net trade creation effect of AEC for total trade is reported at 0.45; where it is identical to 56.05% increase in the aggregate trade volumes as a result of the adoption of AEC blueprints in 2007.

When the effect of AEC_{1ijt} effect is estimated for different commodities, there are substantial trade diversion effects for the exports of the machines & apparatus, miscellaneous manufactured articles, manufactures of plaiting material & basketwork and tobacco & manufactured tobacco substitutes, even if the trade creation effects for fur-skins & artificial fur manufactures and limestone materials for manufacture of lime or cement, are small.

As AEC_{2ijt} is estimated for the different products, there are substantial trade diversion effects for the exports of machines & apparatus, even if the trade diversion effects for fur-skins & artificial fur manufactures, as well as the miscellaneous manufactured articles are small.

When the effect of AEC_{3ijt} is estimated for different groups of products, there are substantial trade creation effects for the exports of tobacco & manufactured tobacco substitutes as well as the manufactures of plaiting material & basketwork, though the trade creation effects for miscellaneous manufactured articles as well as the limestone materials for manufacture of lime or cement are small. Meanwhile, there are significant trade diversion effects in the exports of machines & apparatus.

Above all, the bilateral exports of fur-skins & artificial fur manufacture, manufactures of plaiting material & basketwork, miscellaneous manufactured articles, and machines & apparatus presented its net trade diversion effect at the values of -1.30, -0.23, -0.91 and -4.01, respectively, which equals to the percentage decrease of 72.77%, 20.35%, 59.91%, and 98.18% in the bilateral trade volumes attributable to the signing of the AEC agreements in 2007.

Table 3: Summary of trade creation effects for AEC

	$AEC_{1ijt}(\theta_1)$	$AEC_{2ijt}(\theta_2)$	$AEC_{3ijt}(\theta_3)$	Net effect	Net Trade Creation (Diversion) %
Tobacco & manufactured tobacco substitutes	-1.033		1.499	0.47	59.36%
Fur-skins & artificial fur, manufactures thereof	-0.883	-0.418		-1.30	-72.77%
Manufactures of plaiting material, basketwork, etc.	-1.107	-0.3625	1.242	-0.23	-20.35%
Miscellaneous manufactured articles	-1.266	-0.532	0.884	-0.91	-59.91%
Limestone materials for manufacture of lime or cement	-0.321		0.562	0.24	27.25%
Machines & apparatus	-1.285	-1.386	-1.338	-4.01	-98.18%

Note: Only significant effects are included in calculation of net effect.

In contrast, the net trade creation effect of AEC for tobacco & manufactured tobacco substitutes, and limestone materials for manufacture of lime or cement are reported as 0.47 and 0.24, which are on par with the percentage increase of 59.36% and 27.25% in the bilateral manufacturing trade volumes.

Taken as a whole, there are substantial trade creation effects for the exports of tobacco & manufactured tobacco substitutes, even if the trade creation effects in favor of the limestone materials for manufacture of lime or cement, is small. On the other hand, there are substantial trade diversion effects for the exports of the fur-skins & artificial fur manufactures, manufactures of plaiting material & basketwork, miscellaneous manufactured articles, as well as the machines & apparatus.

Summary and Conclusion

This study aims to examine the impact of the signing of ASEAN Economic Community (AEC) blueprint on the bilateral aggregate and manufacturing trade between the member countries of ASEAN and its trading partners.

In the present study, the gravity model is employed in panel estimation from the period of 1995 to 2014 between the ASEAN-10 members and its 39 trading partners. The results for tobacco and manufactured tobacco substitutes, fur-skins & artificial fur, and manufactures of plaiting material & basketwork products revealed that the AEC has generated the trade diversion as well as reduction of intra-bloc exports of tobacco & manufactured tobacco substitutes. An overall trade diversion effects attributable to the AEC implementation in terms of exports and imports for limestone materials for manufacture of lime or cement and machines & apparatus are identified.

The significantly positive results for aggregate data confirm that reduction and elimination of the tariff barriers in AEC stimulate the total aggregate trade between intra-bloc member countries, intra-bloc countries as well as extra-bloc countries. As the overall effects of AEC are estimated for different group of commodities, there are substantial trade creation effects for the exports of tobacco & manufactured tobacco substitutes, though the trade creation effects for limestone materials for manufacture of lime or cement, is small. On the other hand, there are substantial trade diversion effects for the exports in the fur-skins & artificial fur manufactures, manufactures of plaiting material & basketwork, miscellaneous manufactured articles, as well as the machines & apparatus.
