Effectiveness of Online Capacity Building Programs in Wholistic Development of Faculties: An Empirical Analysis

G.K. Chetan Kumar, Research Scholar, Department of Studies in Economics, Davangere University
 Dr. K.B. Rangappa, Professor, Department of Studies in Economics, Davangere University
 Dr. Suchitra S, Professor, Department of Studies in Economics, Davangere University

Abstract

Purpose- Faculties have a vital role to play in ensuring that their graduates are trained with relevant skills. Formally arranged capacity building programs can aid in training and retraining the faculties with relevant contemporary skills so that, they in turn can do justice to their students. The purpose of this study is to analyze the efficacy of such public funded online capacity building program in enhancing faculties' research and teaching capabilities.

Design/Methodology/Approach- Scientifically designed questionnaire was sent to faculties who attended 12-day public funded online capacity building workshop. Binomial Logistic Regression Models were constructed to analyze as to how effective the online workshop was in enhancing teaching and research skills of the faculties involved.

Findings- From our research we were able to infer that although faculties were able to understand theoretical concepts of qualitative nature relatively easily, they felt that its value addition in enhancing their research output was rather limited. The study also found that, the faculties felt teaching concepts outside their 'syllabus' to be counterintuitive. Significant finding of our study was that research had an important role in enhancing their teaching efficacy.

Originality/Value- Studies which are undertaken to test the efficacy of online capacity building workshops are scarce. This domain is going to gain importance in near future as technology is evolving at a rapid rate and online training of faculties helps in optimizing scarce resources.

Keywords Faculty development Program, contemporary skills, public funded programs, career orientation, research skills, online training.

Paper Type Research Paper

1. Introduction

There is a growing consensus among the teaching fraternity that, education to serve its purpose must bridge the gap between industry and academia (<u>Bisaria,2011</u>). To achieve the same, there is a need to restructure the syllabus regularly. Doing so ensures that, the syllabus is in line with the needs, expectations and requirements of the industry. Any youth acquiring such relevant skills from contemporary education shall be able to secure both his life and livelihood (<u>Leicht et al,2018</u>; <u>Zucca-Scott, 2010</u>). For providing relevant education, regular training of teachers plays a vital role. This would help them to inculcate relevant skills and knowledge among their students which in turn would enable their students to be an asset for their family and society (<u>Gol, 2020</u>).

A teacher to stay relevant in his or her chosen domain must not only be a good academician but must also be a good researcher (Mulford, 2003). Teaching and research are inseparable from one another. Teaching is not just about theoretical concepts. Even if the teacher tries to explain the theoretical concepts without practical implications, the students would not be in a position of using that theoretical knowledge to solve practical problems. If knowledge of any particular domain cannot serve the greater purpose of identifying and solving contemporary problems of the society, then such knowledge cannot be considered as wholistic or relevant. An academician with a researcher's mindset will be capable of leveraging theoretical knowledge to identify and critically dwell upon contemporary issues of relevance. Such a teacher would be in a better position to guide his or her students to effectively use their subject knowledge to bring about betterment in their life and society. In this regard, if an academician wants to do justice to his subject, he must train himself to be a good researcher. (Begum & Ahmed, 2015). This is more so true in case of faculties belonging to humanities and management. This is so because, in pure sciences observations are universal. For instance, law of gravity holds the same, despite spatial and geographical construct. When it comes to theories and observations of social sciences and management, they are not only influenced by the prevailing socio-economic factors, but also by the constructs of space and time. In this regard what can be regarded as true for one nation, one culture, or sometimes even one region cannot be equally valid for the other. Hence, research is important. Further, quality and precision of inferences depends upon the nature and construct of statistical tools. This in turn, requires the faculties to be trained in advanced statistical tools and packages (<u>Misra,2012</u>).

As important as training can be to faculties, one cannot realistically expect the faculties to dedicate time and resource for self-upgradation without any formal support. The technical nature of advanced statistical tools, packages and empirical concepts are such that it requires an experienced mentor to guide them (<u>Chappell,2000</u>). Even if faculties are adept in learning, formal training sessions help them to get a better clarity and understanding of the concepts in question (<u>Irene Tuffrey-Wijne et al, 2020</u>).

When it comes to undertaking formal training at macro level, the importance of leveraging information communication technology to achieve the objectives of training, cannot be undermined (<u>Gulbahar and Guven</u> <u>2008;Fuglestad 2009</u>; <u>Kumar, B. A et al., 2020</u>). Online training programs comes with a plethora of advantages as compared to conventional training programs. They help the resource person and participants alike to overcome time and spatial constraints. Many studies have already been undertaken to evaluate the efficacy of online teaching and training programs with focus on students. However, there are scarcity of such studies with regards to faculties. Our study seeks to bridge this gap.

Our study, is more so relevant in context of Karnataka. Karnataka is not only one of the pioneer states in implementing National Education Policy 2020, but teaching-learning pedagogy of its traditional universities leaves much to be desired. In this backdrop, syllabus, particularly of social science faculty is being radically redesigned to address the practical problems of contemporary world. Till now in the field of social sciences, particularly in the traditional universities of Karnataka, emphasis on either using econometric tools or inculcating teaching-learning pedagogy which emphasized on understanding and solving contemporary problems through empirical analysis was rarely present. The National Education Policy emphasizes on promoting practically relevant multidisciplinary studies in undergraduate and post graduate courses (<u>Aithal & Aithal, 2020;Malik,2021</u>). To ensure that the faculties are well equipped to do justice for the aforesaid objective, Indian Council of Social Science Research (ICSSR), a government agency, is actively funding online and offline faculty development programs to inculcate required skill set among teaching fraternity of higher educational institutions. Given the spatial constraints and work commitments, that the faculties have, online faculty development programs are seen as relatively more flexible and easier to attend. In this backdrop, our study has attempted to analyze the efficacy of online faculty development programs conducted by ICSSR in bringing about teaching and research improvement among the faculties in the state of Karnataka, India.

2. Literature Review

Previously undertaken studies (<u>Buchanan, 1999</u>; <u>Peters, O., 2000</u>; <u>Selwyn 2016</u>) assert that Information Communication technology can positively enhance teaching learning experience. Information communication technology in the field of education refers to any service, application or digital device which could enhance learning experience. Some of the studies (<u>Bousbahi & Alrazgan, 2015</u>; <u>Harris & Rea, 2019</u>) indicate that current generation learners are more adept in using information communication technology than their teaching facilitators. Teachers to stay relevant in their domain and do justice to their responsibility must be trained on regular basis. Formal training programs are more beneficial to provide the necessary training to faculties. Despite the obvious advantages of offline training programs, it has its share of spatial and time constraints which may dissuade interested participants from participating in them (<u>Chetan, et al.,2021</u>). A feasible noteworthy alternative can be found in online platforms. Advent of covid-19 and its consequent impact on academia has inadvertently shown the feasibility of using online platforms for learning and training. Although many studies (<u>Nadaf,2017</u>) have tried to identify the efficacy of online platforms in dispersing knowledge to students, such studies with regards to training teachers are scarce.

Although using ICT to enhance teaching learning experience has been in vogue in western setup, such developments are relatively new in context of developing countries. In the backdrop of National Education Policy 2020 of India, there has been a genuine effort to inculcate decision sciences in humanities and management with an objective of making the students become problem solvers rather than just job seekers. Faculties, often cite time and personal commitments as a hurdle to attend Capacity Building Programs (CBPs). In this backdrop online training of faculties can go a long way in addressing the aforementioned concerns.

However, online Capacity Building Programs are relatively new in India. They started gaining prominence in the aftermath of covid-19 induced nationwide lockdowns which were imposed in 2020 (Yekin, 2020) and 2021. Even after 2021, apex research institutions like ICSSR are actively funding online CBPs to improve research and teaching skills of faculties. As contemporary studies relating to efficacy of such online CBPs for teachers are scarce, our study aims to bridge the concerned research gap.

3. Objectives

1. To analyze the extent to which the faculties attending online capacity building program were able to understand research and teaching concepts.

2. To analyze, as to how effectively faculties can practically implement concepts related to research and teaching in real world.

4. Research Methodology

4.1 Data Collection and Sampling Design

ICSSR has been actively organizing online and offline capacity building programs to facilitate improvement of teaching and research skills among faculties belonging to humanities, commerce and management. Data was collected by the investigator in one such 12 day online CBP which was conducted by Economics Department of Davangere University, Karnataka, under the sponsorship and guidance of ICSSR. A scientifically designed questionnaire was sent via google form to all the participants who had participated in the online CBP. Out of 253 participants, 175 responded.

Nature of Program - The syllabus of 12-day online CBP broadly comprised of 3 sections. First section dealt with theoretical concepts of research. Second section comprised of classroom teaching methods and the last section dealt with statistical and inferential tools.

4.2 Characteristics of Sample

Designation & Nature of Employment- Among 175 respondents, 80.57 percent were serving as Assistant Professors. 12 percent were serving as Lecturers and 7.42 percent were pursuing full time research.

Qualification- Among the respondents, 17.14 percent had completed Masters. 39.42 percent were pursuing doctorate and 43.42 percent had completed their doctorate.

Age- Age of faculties ranged from 33 years to 55 years of age whereas age of research scholars ranged from 23 years to 45 years of age.

Preferred medium of instruction among Respondents - Among respondents, 50.28 percent of the participants preferred English as a medium of instruction, whereas 49.14 percent preferred regional language as medium of instruction. It is to be noted that in the program, only English was used as the medium of instruction.

Familiarity among statistical tools among respondents- Among respondents, with regards to statistical packages, 35.47 percent of participants were familiar with E-views, 36.67 percent of participants were familiar with SPSS and 32 percent of the participants were familiar with STATA. As far as programming languages like R and Python were concerned, only 30 percent of the participants were familiars were familiar with them.

4.3 Relevance of the sample in context of Study

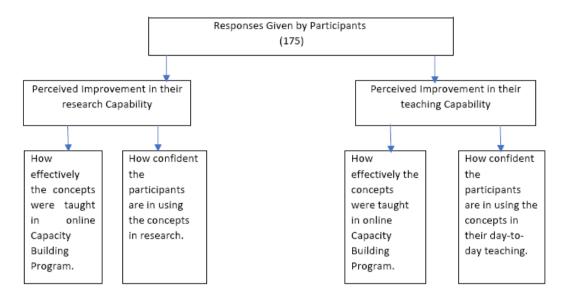

Among 175 respondents, 80.57 percent were serving as Assistant professors. Of whom 82 percent were working in Government run Educational Institutions. Furthermore, nearly 85 percent of the respondents were below 50 years of age. Given, the importance of government institutions in serving the needs of masses and the emphasis of NEP in inculcating decision sciences in humanities, along with spatial and time constraints of offline

workshops, evaluating efficacy of online CBP with the sample at hand was relevant for strengthening the academia.

4.4 Research Model's Design

The objective of the study was to understand the efficacy of online CBP in enhancing teaching and research capabilities of faculties involved. The two categories were further subdivided to garner inference on how well the participants were able to understand the concepts which were taught in online platform and how confident they were in incorporating the same in their teaching and research.

The design of the model is summarized in figure 1.

4.5 Item Reliability Test

Cronbach's alpha-To check the internal consistency of closely related sets of questions in the questionnaire, Cronbach's alpha was used. The results of Cronbach's alpha pertaining to various sets of questions designed to capture the relevant information are summarized in table I.

Table I: Value of Cronbach's Alpha pertaining to various sets of questions

Sets of Questions pertaining to	Number of Items	Value of Cronbach's Alpha
1. Perceived improvement in research capability of the faculties in the backdrop of how the concepts were taught in the workshop		
Items pertaining to Qualification (2) Infrastructure (3) Familiarity with basic software (4) Familiarity with advanced software (4) Perceived improvement in using the concepts taught in workshop (28)	41	0.94

 2. Perceived degree of confidence among faculties in practically using the concepts in their research Items pertaining to Qualification (2) Infrastructure (3) Familiarity with basic software (4) Familiarity with advanced software (4) Perceived Confidence among faculties in practically using the concepts taught in workshop (28) 	41	0.95
 3. Perceived improvement in teaching capability based on the concepts taught in the program Items pertaining to Qualification (2) Infrastructure (3) Familiarity with basic software (4) Familiarity with advanced software (4) Perceived improvement in teaching capability among faculties through the concepts taught in workshop (28) 	41	0.95
 4. Perceived degree of confidence among faculties in practically teaching the concepts that they had learnt to their students Items pertaining to Qualification (2) Infrastructure (3) Familiarity with basic software (4) Familiarity with advanced software (4) Perceived degree of confidence among faculties in teaching the the concepts that they have leant in workshop (28) 	41	0.94

From table I, we can observe that scale reliability coefficient of Cronbach's alpha is in the range of 0.94 to 0.95 indicating that the questions framed in the schedule are closely related with each other.

Binary Logistic Regression Model- is used when we are supposed to predict the probability of success when the dependent variable can have either one of two categorical outcomes. In the model, the favorable outcome is designated as 'success' whereas the other outcome is considered as reference category. As all the dependent variables in our models were of qualitative nature with binary outcomes, we have made use of this model.

Binary Logistic Regression for a dichotomous categorical variable 'Y' with multiple explanatory variables, x_1 , x_2 , x_3 ..., x_k can be represented with the help of the following equation (<u>Ari, Erkan., 2016</u>):

Logit [P(Y=1)] =
$$\alpha$$
+ $\beta_1 x_1$ + $\beta_2 x_2$ + $\beta_3 x_3$ + $\beta_4 x_4$... + $\beta_k x_k$

Which can also be represented by directly representing $\pi(x)$ as:

$$\pi(\mathbf{x}) = \frac{n \exp\left(\alpha + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_k x_k\right)}{1 + \exp\left(\alpha + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_k x_k\right)}$$

In the above equation β_i refers to the effect of x_i on the log odds that Y=1, controlling other x_j (Ari, Erkan., 2016).

Two stage method has been used to estimate predicted probability of success in perceived improvement of research.

> Calculation of odds ratio: The following formula has been used to estimate odds ratio;

$$\ln(p-hat/1-p-hat) = \beta_0 + \beta_1 x_1 + \beta_2 x_2 \dots$$
 estimated.

Calculation of estimated probability: Expected Probability of success is calculated with the help of the following formula:

p-hat= exp(
$$\beta_0 + \beta_1 x_1 + \beta_2 x_2$$
 ...)/1+exp($\beta_0 + \beta_1 x_1 + \beta_2 x_2$...) estimated.

4.6 Identification of Variable

To understand as to how effectively the concepts were taught and how confident the faculties were in using the same in the domains of teaching and research, four binomial logistic regression models were constructed.

First Regression Model

$$Y_{1,1} = \alpha_{1,1} + \beta_{1,1}X_{1,1} + \beta_{1,2}X_{1,2} + \beta_{1,3}X_{1,3} \dots \dots \dots \dots \dots + \beta_{1,40}X_{1,40} + \beta_{1,41}X_{1,41} \qquad \qquad \dots \ (1)$$

In equation (1), the dependent variable is the "Efficacy of concepts taught in improving Faculty's research capability"

The independent variables of the first regression model along with their coefficients are summarized in Table II.

Second Regression Model:

$$Y_{2,1} = \alpha_{2,1} + \beta_{2,1} X_{2,1} + \beta_{2,2} X_{2,2} + \beta_{2,3} X_{2,3} \dots \dots \dots \dots + \beta_{2,40} X_{2,40} + \beta_{2,41} X_{2,41}$$
(2)

In equation (2), the dependent variable is the "the degree of confidence that the faculties had in practically using the concepts that they had learnt in workshop"

The independent variables of the second regression model along with their coefficients are summarized in Table III.

Third Regression Model

$$Y_{3,1} = \alpha_{3,1} + \beta_{3,1} X_{3,1} + \beta_{3,2} X_{3,2} + \beta_{3,3} X_{3,3} \dots \dots \dots \dots + \beta_{3,40} X_{3,40} + \beta_{3,41} X_{3,41}$$
(3)

In equation (3), the dependent variable is the "perceived improvement in the teaching perception of the faculties in backdrop of the concepts taught in workshop"

The independent variables of the third regression model along with their coefficients are summarized in Table IV.

Fourth Regression Model

$$Y_{4,1} = \alpha_{4,1} + \beta_{4,1}X_{4,1} + \beta_{4,2}X_{4,2} + \beta_{4,3}X_{4,3} \dots \dots \dots \dots + \beta_{4,40}X_{4,40} + \beta_{4,41}X_{4,41} \qquad \dots (4)$$

In equation (4), the dependent variable is the "confidence among the faculties in practically teaching the concepts that they have learnt in the workshop"

The independent variables of the fourth regression model along with their coefficients are summarized in Table V.

5. Results and Discussions

5.1 Results Pertaining to Binary Logistic Regression

Through the first regression model, an empirical analysis was undertaken to identify as to how well the concepts related to research were taught so as to improve the research capability of faculties. The coefficients of dependent variable across tested categories are summarized in Table II:

Faculty's Satisfaction	Parameters relating to research improvement and conceptual understanding	Coef.	Std. Err.	Z	P>z

In table II, the coefficients of first regression model have been summarized. Through the regression model an attempt had been made to understand the relationship between perceived improvement in research capability, based on the parameters which would have affected the understanding of concepts among the faculties. Among the various factors identified in the table, we find qualification, knowledge of English, familiarity with power point presentations, python, qualitative research methods and online assignments to be statistically significant at 5 percent probability level. From the observation we can infer that faculties believe that, the knowledge of statistical packages are important to effectively understand the concepts which were taught in the workshop. Interestingly, understanding basics of regression, although statistically significant appears to have inverse relationship with perception of improving their research capabilities. It basically means that, the concept of regression was taught in such an ineffective manner that, the faculties seem to have completely misunderstood the concept.

Thus, from the table we can observe that, knowledge of English and advanced statistical packages was conducive to create a favorable learning environment among participants. Interestingly, the participants were able to grasp theoretical concepts easily and seem to have misunderstood the use of empirical tools.

Through second regression model, we wanted to analyse the degree of confidence, that the faculties had in practically using the concepts which they had learnt in workshop. The coefficients of dependent variable across tested categories are summarized in Table III.

Faculty's Satisfaction	Parameters relating to research improvement and confidence in practically using the concepts which were taught in workshop	Coef.	Std. Err.	Z	P>z

From table III we can observe that, the faculties who have higher qualification and were fluent in English were more confident in practically using the concepts which they had learnt in the workshop. From table III, it is interesting to note that, the faculties were confident in using only qualitative tools in their active research. The online workshop seems to have had a very limited success in creating confidence among faculties to use empirical tools.

Through third regression model an attempt had been made to understand the perceived improvement in the teaching perception of the faculties in the backdrop of the concepts taught in the faculty development program. The coefficients of dependent variables across the tested categories are summarized in table IV.

From table IV, we can observe that faculties with higher qualification and greater familiarity with advanced statistical packages feel that, the concepts which were taught for them, helped in enhancing their teaching skills. Among the concepts taught, the faculties felt that, qualitative methods like classroom teaching methods, online data searching, and e-library training would enhance their teaching capability. Among statistical tools, the faculties felt that, measures of central tendency would enhance their teaching capability. Furthermore, we can observe that faculties believed that, they were able to understand theoretical concepts relatively easily as compared to empirical concepts. Furthermore, even the empirical concepts that they had learnt pertaining to teaching and measures of central tendency were of very basic level. As far as statistical packages were concerned, faculties felt that, being familiar with SPSS had an inverse relationship in their perceived improvement of their teaching capabilities. This was on account of two reasons. On one hand, the syllabus which most of these graduate faculties are teaching is deprived of statistical packages. Even if these faculties were to teach statistical packages, due to obvious time constraints, they would not be able to complete their formally assigned syllabus on time.

The objective of the fourth regression model was to evaluate the confidence inculcated by CBP among faculties in practically teaching research & econometric concepts to their students. The coefficients of dependent variables across the tested categories are summarized in table V.

From Table V, we can observe that for teaching of concepts in classroom, using a combination of English and regional language was seen as effective. It is interesting to note that, the faculties were confident to teach triangulation methods, online data searching, writing research article and basics of regression to their students. From this observation, we can note that the concepts which the faculties felt that they could confidently teach to their students were simple in nature or were concepts which they were already familiar with like basics of regression. When it came to new technical concepts and statistical tools like chi square test, faculties didn't feel confident in their ability to teach the same to their students. When it comes to implementation of idealistic teaching methods in classroom, faculties felt that it would be not be of much practical use. In the backdrop of time constraint which the faculties are haunted by, the aforesaid observation makes logical sense. The faculties seem to hold the same sentiment even with regards to practically teaching chi square test.

5.2 Results Pertaining to Estimated Predicted Probability of Success

Table VI helps us in understanding the estimated predicted probability of first regression model.

Variables	Coefficients		Expectations											
C	-8.978	1	1	1	1	1	1	1	1	1	1	1	1	1
Highest Qualification	1.537	0	1	1	2	2	2	2	2	2	2	2	2	2
English	2.378	0	0	1	1	1	1	1	1	1	1	1	1	1
Familiarity with PPT	3.011	0	0	0	0	1	2	3	3	3	3	3	3	3
Familiarity with Python	2.824	0	0	0	0	0	0	0	1	2	3	3	3	3
Qualitative method Taught	3.849	0	0	0	0	0	0	0	0	0	0	1	1	1
Regression Basics Taught	-5.455	0	0	0	0	0	0	0	0	0	0	0	1	1
Online Assignment	2.708	0	0	0	0	0	0	0	0	0	0	1	0	1
Predicted Probability		7.34 e-07	3.41 e-06	5.25 e-05	1.71 e -05	3.0 e-04	0.007	0.125	0.70	0.97	0.998	0.999	0.992	0.999

Table VI: Results of Estimated Probability of Success among statistically significant Independent Variables used in Regression Model 1

From table VI it is interesting to observe that, the familiarity that the faculties have with power point presentation was enhancing their understanding of the concepts thought in econometric workshop by 11.8 percent whereas the familiarity that faculties had of python was able to boost their understanding of the concepts taught in the workshop by 57.5 percent. Hence, we can observe that, the faculties who were familiar with advanced statistical packages were more adept in understanding the research concepts which were taught in the workshop. In addition to that, their familiarity with basic computer software seems to be sufficient but not necessary condition in enhancing their understanding.

In table VII, estimated predictive probability of second regression model has been summarized.

Variables	Variables Coefficients			Expectations										
С	-8.125	1	1	1	1	1	1	1						
Highest Qualification	1.464	0	1	1	2	2	2	2						
English	2.482	0	0	1	1	1	1	1						
Confidence in Triangulation	3.700	0	0	0	0	1	1	1						
Confidence in Online Data surfing	3.564	0	0	0	0	0	1	1						
Online Assignment	3.938	0	0	0	0	0	0	1						
Predicted Probability		0.0001	0.0004	0.0055	0.0237	0.4958	0.97	0.99						

Table VII: Results of Estimated Probability of Success among statistically significant Independent Variables used in Regression Model 2

From table VII we can observe that, the predicted probability of success initially improved by 47 percent when triangulation method was introduced and further improved by 48 percent when online data surfing was introduced. This reflects that the faculties were confident in using triangulation method and online data surfing in their active research. It is interesting to observe that, the CBP didn't instill confidence among faculties in using statistical tools for doing empirical analysis in their active research.

In table VIII, estimated predictive probability of third regression model has been summarized.

Table VIII: Results of Estimated Probability of Success among statistically significant Independent Variables used in Regression Model 3

Variables	Coefficients		Expectations											
C	-9.392	1	1	1	1	1	1	1	1	1	1	1	1	
Highest Qualification	1.410	0	1	2	2	2	2	2	2	2	2	2	2	
Electricity	2.532	0	0	0	1	1	1	1	1	1	1	1	1	
Familiarity with Python	2.013	0	0	0	0	1	2	3	3	3	3	3	3	
Classroom Methods Taught	3.251	0	0	0	0	0	0	0	1	1	1	1	1	

Online Data Searching Taught	2.171	0	0	0	0	0	0	0	0	1	1	1	1
E-Lib Training Taught	2.473	0	0	0	0	0	0	0	0	0	1	1	1
Taught SPSS	2.898	0	0	0	0	0	0	0	0	0	0	1	1
Taught Measures of Central Tendency	2.930	0	0	0	0	0	0	0	0	0	0	0	1
Predicted Probability		2.01 e-06	8.23 e-06	3.37 e-05	0.0004	0.003	0.023	0.15	0.821	0.97	0.997	0.963	0.997

From Table VIII we can observe that faculty's knowledge about advanced statistical package was able to enhance their theoretical understanding of teaching concepts by 15 percent. However, concept related to classroom teaching had 68 percent influence in improving faculties' perception about teaching.

The magnitude of the impact of statistically significant independent variables on dependent variable of fourth regression model in terms of improving predictive probability of favorable outcome has been summarized in Table IX.

Variables Coefficie nts		Expectations											
С	-18.4386	1	1	1	1	1	1	1	1	1	1	1	
Combination of English & Regional Language	5.685312	0	1	1	1	1	1	1	1	1	1	1	
Network Quality	-3.895	0	0	1	1	1	1	1	1	1	1	1	
Electricity	3.347689	0	0	0	1	1	1	1	1	1	1	1	
Ideal Class Room Teaching	-7.77685	0	0	0	0	1	1	1	1	1	1	1	
Teaching Triangulation	9.099634	0	0	0	0	0	1	1	1	1	1	1	
Teaching Online Data	6.110049	0	0	0	0	0	0	1	1	1	1	1	
Teaching composing Research Article	11.83065	0	0	0	0	0	0	0	1	1	1	1	
Teaching Chi-Square test	-9.87428	0	0	0	0	0	0	0	0	1	1	1	
Teaching Basics of Regression	11.2584	0	0	0	0	0	0	0	0	0	1	1	
Perceived Improvement in Research Quality	11.46919	0	0	0	0	0	0	0	0	0	0	1	
Predicted Probability		6.18 e-13	1.82 e-10	3.70 e-12	1.05 e-10	4.42 e-14	3.95 e-10	1.78 e-07	0.023	1.26 e-06	0.088	0.99	

Table IX: Results of Estimated Probability of Success among statistically significant Independent Variables used in Regression Model 4.

From table IX, we can observe that, among the independent variables impacting the efficacy of teaching among faculties, only basics of regression had the highest weightage. The above observation implies that although concepts like triangulation methods, online data searching, composing research articles were thought to be useful by the faculties in improving their practical teaching, the magnitude of their impact were negligible in terms of enhancing their research. When it came to practical teaching, faculties genuinely felt that, only

regression was useful. Furthermore, faculties believed that, inculcating ideal classroom teaching techniques would have had detrimental effects in practical teaching-learning pedagogy. This observation could be justified on the grounds that faculties would have been under tremendous pressure of completing their assigned portion on time. This pressure created coupled with uneven teacher student ratio would have adversely affected implementation of innovative and idealistic teaching techniques. This is more so true given how ill trained the faculties are and how ill equipped most of the educational institutions in Karnataka are to inculcate innovative teaching learning methods.

6. Conclusion

Indian Education system is in a transition phase. Not only in India, but also most of the developing world's education system is in the transition phase form teacher centric education system to student centric education system. The advent of COVID-19 has acted as a catalyst for the same. To inculcate an education system which would facilitate bridging industry-academia gap there are two things which must be done simultaneously. Along with structurally redesigning the entire syllabus to bridge the gap between industry and academia, there is also a need to train the faculties to teach the same. In training the faculties with state-of-the-art techniques and statistical packages, online platforms have an increasingly important role to play. In this backdrop, our research concludes that medium of instruction has an important role to play in enhancing the understanding of concepts in teachers training workshops. Although faculties were able to understand theoretical concepts, they found themselves at unease when it came to understand technical concepts, statistical tools and operating statistical packages. From the inferences of our study, our intention is not to downplay the efficacy of online faculty development workshops in teaching statistical or empirical tools. What our study wants to reiterate is, although online medium for faculty development programs can be used to teach theoretical concepts in traditional format, the same cannot be said with regards to using online platform to teach empirical and statistical packages. What we want to point out is that , an innovative and proactive approach is to be inculcated in CBPs, if they are hoping to advance the skill and knowledge of the faculties. It was a bit ironical that, according to the perception of faculties, knowledge of statistical techniques and packages were detrimental to their research. This reflects as to how poorly such technical concepts were taught in the workshop. This also reflects a need to revamp the way in which technical concepts are taught in online CBP. Proactively engaging the audience to have an interactive session would be a good place to start. Furthermore, the importance of quantitative and qualitative tools cannot be dismissed in the realm of social sciences. By using predicted probability model, our study was able to ascertain that quantitative and empirical tools play an important role in enhancing the teaching and learning capability of faculties. Hence, although online workshops can play an important role in promoting the learning capability among scholars and faculties alike, it has its unique limitations which requires to be tackled with innovation and unconventional approach.

7. Implications of the Study

1. Through our study we were able to statistically ascertain that, faculties who were more fluent in English were able to understand and practically use the concepts with greater ease in research. To facilitate greater collaboration among academia in a multilinguistic country like India, using English as medium of collaboration and cooperation seems to be a step in right direction. Most of the faculties who participated in our study were using regional language as a medium of instruction in their respective educational institutions which seems to have adversely affected their fluency in English. Hence in this backdrop efforts must be undertaken to promote teaching and learning with English and regional language particularly in Government run institutions.

2. In the workshop an effort was made to teach theoretical and empirical concepts to faculties. However, our empirical inferences reveal that although faculties were able to develop theoretical understanding of qualitative concepts, contribution of the same in enhancing their practical research was rather limited. Furthermore, when it came to statistical and empirical tools, like chi square and regression the faculties doesn't seem to have understood the concepts at all. Online CBPs must be designed in such a manner that statistical packages are used to teach statistical and empirical tools. Teaching must be practically relevant. In addition to it, a systematic and meticulous record of operating and using of statistical tools should be maintained and provided to participants after the end of workshop for the purpose of revision.

3. Our study was able to ascertain that faculties' expertise in research significantly contributed to enhance their teaching capability. Furthermore, with regards to teaching-learning pedagogy, faculties found inculcating advanced statistical packages and new empirical concepts to their graduate and post graduate students visibly detrimental. This was so because, these concepts are not part of their syllabus, particularly of courses belonging to humanities. In this regard, for the benefit of all stakeholders, Government must ensure that mandate of practically relevant research-oriented teaching is not only applicable for university faculties but is also equally applicable for graduate and post graduate faculties working in colleges. Promoting research in wholistic manner in colleges at both graduate and post graduate level is not only going to help in making faculties better teachers but shall bring in practical perspectives in teaching. Hence inculcating this approach shall go a long way in bridging the industry- Academia gap.

8. Contribution

Our study re-ascertains the importance of research in enhancing teaching capability among faculties. It is also to be noted that, through CBP, faculties were able to grasp theoretical concepts relatively easily as compared to empirical concepts. Hence, ICSSR funded online capacity building programs, must have a refined approach in teaching empirical concepts in online platform as has been illustrated in our implications.

9. Limitations

Online Capacity Building Program is a novel initiative which has started to gain prominence among Indian academia in recent years. Hence while constructing our model, we could not incorporate systematic random sampling as our population's size was small and obscure. Hence, we collected data from participants who attended 12-day online capacity building program.

The inferences from our study could not be generalized as not all faculty's viewpoint could be represented by just one such online workshop. Repeated cross sectional studies involving various regions and states of India is going to provide a better understanding about the efficacy and efficiency of ICSSR sponsored online capacity building programs in enhancing teaching and research capability of faculties.
