Abstract

Consumer behaviour research is the scientific study of the processes consumers use to select, secure, use and dispose of products and services that satisfy their needs. Firms can satisfy those needs only to the extent that they understand their customers.

The main objective of this paper is to study the gender differences in consumer buying behaviour of a Portuguese population when they go shopping to buy apparel products. To attain this objective a survey was developed and administered across Portugal. The findings confirm the differences between women and men especially in terms of What, Where, When, and How they buy.

Keywords: Consumer buying behaviour, Apparel, Gender.

JEL: M30, L81

1. Introduction

The relation between dressing and the idea of individual expression is complex. It may be perceived in people's daily life through recurrent use of the same clothing colours, brands, fashion tendencies etc. Many people use contrasts and colours that express feelings according to their state of mind. Thus, the products' properties, like design, comfort, individuality, have a decisive role on apparel's buying behaviour, which may vary depending on a set of factors, mainly on sex (Fischer and Arnold, 1994).

There is a widespread recognition that consumer behaviour is the key to contemporary marketing success. In this way, the field of consumer behaviour has been characterized by a diversity of viewpoints and based on an interdisciplinary science. In this context, the understanding of consumer behaviour could appeal to a set of different areas of knowledge, such as psychological, cultural social psychological, physio-psychological, genetics anthropology." The main objective of this paper is to study the gender differences in consumer buying behaviour of a Portuguese population when they go shopping to buy apparel products. To attain this objective a survey was developed and administered across Portugal. The findings confirm the differences between women and men especially in terms of What, Where, When, and How they buy.

The paper starts with the presentation of the relevant literature in the area of buying behavior and then the research hypothesis is described. After that the methodology followed to develop the study is presented with a special reference to the sample method, data collection and statistics. Next, the results are presented and discussed and finally the conclusions are drawn.

2. Consumer Behaviour approaches

Consumer behaviour research is the scientific study of the processes consumers use to select, secure, use and dispose of products and services that satisfy their needs. Knowledge of consumer behaviour directly affects marketing strategy (Anderson *et al.*, 2005). This is because of the marketing concept, i. e., the idea that firms exist to satisfy customer needs (Winer, 2000). Firms can satisfy those needs only to the extent that they understand their customers. For this reason, marketing strategies must incorporate knowledge of consumer behaviour into every facet of a strategic marketing plan (Solomon, 2002).

...The human behaviour is complex, replete with controversies and contradictions and comes as no surprise to marketing academicians as well as practitioners. There is a widespread recognition that consumer behaviour is the key to contemporary marketing success (Hawkins *et al.*, 2003). Consumer behaviour has been legitimized in marketing for it provides the conceptual framework and strategic thinking for carrying out successful segmentation of markets (Schiffman and Kanuk 2000).

There have been a number of debates between positivistic and interpretive consumer researchers (Hudson and Ozanne 1988). In this way, the field of consumer behaviour has been characterized by diversity of viewpoints; as a result, the entire field now is based on an interdisciplinary science (Kassarjian 1995).

The understanding of consumer behaviour appeals to a set of different areas of knowledge/factors: psychological, cultural social psychological, physio-psychological, genetics anthropology. One of them is the psychology since consumer behaviour deals with emotions, beliefs and attitudes. Research on emotions within marketing has evolved three approaches: the categories approach, the dimensions approach and the cognitive appraisals approach (Watson and Spence, 2007). The categories approach groups emotions around exemplars and considers their different effects on consumption related behaviour.

The dimensions approach uses the affective dimensions of valence and level of arousal to distinguish between emotions and the effects they have on consumer behaviour. The cognitive appraisals approach has used emotions' underlying motivational and evaluative roots to explain their influences on consumption related behaviours. This approach supposes that underlying evaluations of a situation (e.g. its desirability, certainty, etc.) combine to elicit specific emotions. This approach may be used to explain how an extensive range of emotions, including those with similar valence and arousal levels, are elicited and how they lead to different behavioural responses. The cognitive approach has been considered relevant for understanding the emotional responses of consumers in the marketplace (Johnson and Stewart, 2005: 3). Bagozzi *et al.* (1999) propose that the cognitive appraisals approach offers a more complete explanation of consumers' behavioural responses to emotions than other one.

What is apparent from the new learning, however, is that we potentially miss those beliefs and attitudes held at the unconscious or implicit level that can be crucial to determining consumer behaviour. Also the memory that people hold on their consumer experiences will drive both aversion and preference towards products. Aversion behaviour is our avoidance of certain things (brands or marketing offers) made to us as consumers.

The importance of the implicit memory in terms of its capacity to process and store information cannot be understated. The implicit memory registers vast amounts of input from our surrounding environment as we move through life. Millions of experiences that we have had throughout our entire lives are stored away in a particular part of our memory system and can be instantly accessed to help us develop an intuitive 'feeling' about what we should, or should not do. The critical issue, however, is that most of the associations that drive intuition reside in the unconscious part of our brain. They are brought into play automatically, and are not the subject of conscious awareness. We can't normally articulate the basis of our intuitions. So consumers often make brand choices intuitively, and cannot tell why they made that choice.

Fishbein's (1967) attitudinal model has also been widely used in the marketing context (Lilien *et al.*, 1992), and this paradigm provides researchers with a useful lens for examining the factors explaining consumer purchasing intention and adoption. According to this model, behaviour is predominantly determined by intention. Other factors like attitudes, subjective norms, and perceived behavioural control also are shown to be related to an appropriate set of salient behavioural, normative, and control beliefs about the behaviour. However, Fishbein's model stops at the adoption level and does not capture other important factors that explain and predict consumer continuance behaviour (repurchase). The expectation-confirmation model (Oliver, 1980), on the other hand, focuses on the post-purchase behaviour. It is a widely used model in the consumer behaviour literature, particularly in explaining consumer satisfaction and repeat purchase. Satisfaction is the central notion of this model, which is formed by the gap between expectation and perceived performance. The expectation-confirmation theory suggests that if the perceived performance meets one's expectation, confirmation is formed,

and consumers are satisfied. Bhattacharjee (2001) stated that satisfied users are more likely to continue purchasing the same products.

As regards cultural it is the main external factors that shape human behavior. It represents living style, which came into being after adjustments to the environment, people, and things through generations. The effect of culture on people's life is so great that it will even affect the motives and choices when consuming or shopping (Chang, 2005). Otts (1989) defined culture as "All technologies, beliefs, knowledge and fruits that people share and transfer to next generations." Taylor (1958) believed that culture was everything that an individual learns in society. It is a combination of knowledge, beliefs, arts, morals, laws, customs, and any other capabilities and customs. Culture is one of the main factors to determine behavior. The two external factors (culture and physical environment) and two internal factors (physiological and psychological factors) interact and form the basic factors to determine human behaviour. Culture also includes three parts, namely culture, subculture, and social class. Culture is the most basic deciding factor of human desire and behaviour. Everyone is included in many smaller subculture groups, which provide a clearer sense of identification and social process. Basically, subculture can be divided into four types: nationality groups, religious groups, racial groups, and geographical regions. Many subcultures can form some important market segments, and provide the decision reference on product designs and marketing campaigns for marketing personnel to serve the demands of consumers (Jen, 1990).

Through the interactions of the group, different people's experience and individual characteristics were combined. During the combination process, individuals would seek someone highly matched to himself in order to form a subgroup or small group together. Schein (1985) believed the subgroup could form a common history through a certain time development, by sharing experiences, attitudes, communication methods, and individual personalities, and, in doing so, give birth to subculture. The individual life style is affected by the interaction of internal factors such as value and personality characteristics, and external factors such as society and culture, and also reflects on daily life activities. According to the paradox of personality in marketing, we all have a personality, but we do not know how it is systematically related to our consumer behaviour (Albanese, 1989).

Social psychology is another knowledge field that helps to understand consumer behaviour. The social psychology focus on the understanding of individuals behaviour in the presence of other individuals or groups. Concepts such as social perceptions, social influence, social rewards, peer pressure, social cues, social sanctions, etc. all shed light on the mysteries of consumer behaviour. Approaches to understanding consumer behaviour have emphasized external influences on consumption-related acts. The whole idea behind this reasoning is that consumer behaviour takes place within the context of groups and other individuals' presence which influences consumer's processing of information and decision making (Engel et al. 1968).

Another area of knowledge that has been used to a better understanding of consumer behaviour is the physio-psychological one. Physiological psychology is the study of the interaction of the body with the mind. It is the study of the extent to which behaviour is caused by physical and chemical phenomena in the body (Morris 1996). Kroeber-Riel (1980) pointed out that cognitive and psychological processes originate from physiological ones. This field holds many promises for explaining consumer behaviour. For instance, the hypothalamus is that center of the brain which mainly controls consumption (Zimbardo and Gerrig 1996). The chemical changes due to the use/eat of the first product results in a blood borne input to the brain to activate further consumption. Thus, the individual would order one more product to use/eat. Such a behaviour is explained based on the research findings on the functions of the hypothalamus and other related areas of the brain (Valenstein, *et al.*, 1970; Zhang et al. 1994). Physio-psychology provides fascinating ways to help understand consumer behaviour without looking into the consumer's "black box" for hypothetically based variable explanations.

To explain consumer behaviour further, new frontiers in science were introduced such as genetics and anthropology (Demirdjian, and Senguder, 2004).

According to genetics approach our genes direct our consumption behaviour. Perhaps humans are all programmed to act in certain ways in their consumptive and consumer-related behaviour. Is the presence of certain genes that compel us to consume certain kind of products. Genetic science may very well come up with definite findings to explain consumer behaviour and thus we may strike a vein of truth in finding explanations and laws of consumer behaviour (Feder, 1977).

Business anthropology and its implementation in consumer behaviour studies have demonstrated to the business world that anthropological approach as new perspective will bring a new era for the consumer science. The applied anthropologists will become the hottest candidates for business related research jobs given the fact that anthropological methods are becoming more widely acceptable in the business world in general and in consumer studies particular (Demirdjian and Senguder, 2004).

According to the literature and aimed at answering the research questions of this study (Which are the main differences in apparel consumer behaviour between women and men?) the subsequent hypothesis (H1) is formulated: "There are differences in consumer behaviour according to the sex".

After testing this supposition, it follows a more detailed analysis of the main behaviour differences between men and women according to: (i) *what* (what one buys, what one values the most in clothing); (ii) *how* (alone or with someone, with whom one buys, by necessity or by impulse); (iii) *where* (stores with certain atmospheres) and; (iv) *when* (frequently or not, state of mind).

3. Method: Sample, Data Collection and statistics

Concerning this investigation's unfolding, we chose the non random sampling technique, i. e., the population elements' selection to form the sample depends, partly, on the researcher's judgment. There are no known conjectures that a random element in the population may have a share in the sample (Mattar, 2001). Blended with this sampling technique, we also used the *snowball* sampling process. This is a kind of intentional sample among which the researcher chooses a starting group of individuals to whom he asks for names of other individuals belonging to the same population. In this way, the sample keeps growing like a snowball, while new individuals are suggested to the researcher (Rao, 2000).

So, in this investigation we chose to send the questionnaire by e-mail to all the researcher's mailing list contacts living in the country, and, later, to diffuse it using the *snowball* technique to successive contacts of the first responders and we got 221 answers.

The questions in the questionnaire are mainly closed. We chose this kind of questions, because they have more inherent advantages, i. e., they assure comparable answers, for they vary little, offer to those who answer an acknowledgement task, they are easier to answer and also because they offer more easily examinable, reliable, and statistically treatable answers (Foddy, 2001).

Concerning the answers obtained from the questionnaires, they are measured according three kinds scales: ratio scale, Lickert scale and dichotomic scale. Yet, in order to get the answers more quickly, they were sent by e-mail.

The questionnaires were sent and received by e-mail, and its answers exported to the SPSS 15.0 software, in order to get the statistical treatment. So that we could find answers for the question arisen, we used descriptive statistics and, to test the formulated hypothesis (H_1), we used the t-student test¹.

4. Results and Discussion

As for the characterization of the sample and, more precisely, in what concerns the profile of the clothing consumer to which this study is related, starting from his age, we see that he is distributed, in a very homogeneous way, by the three age ranks (18-25, 26-32 and ≥ 32 years), although it was evident a more significant prominence in the 18-35 years rank (36,1%). This homogeneity of the sample avoids problems of obliquity that would arise in the answers, that would happen if there were more preponderant ranks. As for the responders' occupation, we realized that a significant percentage (27,6%) is formed by students, followed by independent workers (16,3%), and thirdly by assignment workers (13,1%). Concerning educational qualifications, we see that the sample's great majority (61,5%) in this study is formed by people with a degree. The second group has secondary education (20,4%). As for the marital status, the responders of this study are mainly single and do not have children (52,5%). It is also interesting to notice that those who are married with or without children have the same percentage (16,3%). Finally, our sample also has a greater number of women (58,8%) than of men (41,2%), although this difference is not very expressive.

Women and Men have different buying behaviour when they go shopping?

When we try to find an answer to the investigation question arisen in this paper, firstly we will display the data concerning the hypothesis test and, then, the descriptive statistics that allow us to reinforce those results and better understand those differences.

Thus, beginning with analyzing if there are indeed some behaviour differences between women and men when they go shopping, we see, through the observation of the results obtained by the hypothesis H_1 test (there are differences in the consumer buying behaviour according to the gender) that men and women show different behaviours (Attachment 1). Particularly in what concerns the influence level of a set of factors about the behaviour of buying clothing, we see that they have different levels of influence depending if they are men or

¹ The t-student test is used to analyze the difference in medium values, i. e., to analyze the differences in the consumer behavior according to his gender, used in the variables respecting the Lickert scale or the ratio scale.

women. These factors are: publicity in fashion magazines, women’s magazines, catalogues, publicity at major events, consumer’s economical situation, the price of the pieces of clothing and if there is sales promotion. Thus, after analyzing the results of tables 1 and 2, we may say that hypothesis is not rejected (there are differences in consumer buying behaviour according to gender), i. e., there are statistically significant differences on the perception of the following factors that exert influence upon the decision of buying clothing depending if it is a woman or a man: (i) publicity in fashion magazines; (ii) women’s magazines; (iii) publicity in catalogues; (iv) outdoors publicity; (v) publicity at major events; (vi) consumer’s economical situation; (vii) if there is sales promotion. These difference are also statistically significant in what concerns the following reasons pointed out by the consumer when he buys a certain piece of clothing, depending if it is a man or a woman: (i) to combine with the wardrobe; (ii) because that brand is linked to a certain status.

Buying Behaviour

Now that the existence of differences of buying behaviours between men and women has been confirmed, then we will analyze, with further detail, which differences there are in terms of: “What one buys?”, “How one buys?”, “Where one buys?” and “When one buys?”.

Starting with “What one buys”, consumers normally look for pieces of clothing that might highlight their physical features. This is valid for men and women. Yet, among men, this concerning is even more evident, for, while 68,1% of them assert that they look for pieces of clothing that might highlight those features, only 60,8% of women do that.

In the sequence of the unfolded approach about what the consumer buys in terms of clothing, we see, through Table 3, that they buy pieces of clothing that might show certain specific attributes, but appreciated in different ways depending on being a woman or a man. So, women consumers appreciate in the first place satisfaction and comfort, followed by function; yet men prefer comfort, followed by satisfaction and, after that, quality.

Table 3: Characteristics/Attributes of pieces of clothing appreciated by consumers

Product’s attributes	Women		Men	
	Mean	Standard Deviation	Mean	Standard Deviation
Satisfaction	6,11	,925	6,08	1,003
Comfort	6,11	1,313	6,11	1,130
Function	5,98	,944	5,58	1,248
Need	5,87	1,361	5,71	1,250
Quality	5,79	1,440	5,85	1,154
Style	5,59	1,017	5,55	,969
Model	5,52	1,058	5,62	1,041
Cut	5,52	1,474	5,45	1,223
Colour	5,50	,966	5,59	1,011
Used materials (Cloth/fibres)	5,38	1,427	5,12	1,272
Durability	5,27	1,225	5,47	1,277
Treatment	5,11	1,271	5,07	1,413

Still trying to find an answer to the question about how to know what consumer buys, we analyzed a set of factors directly related to clothing’s characteristics/attributes, by doing distinct analysis for men and women.

Women Buying Behaviour

Starting with women, and analyzing **what** she buys, we chose to display a piece of clothing, varying it according to its design, brand, price and composition, so that we could better understand the buying decision process (Table 4).

In this context, we see that, in terms of the pieces of clothing’s design, the responders prefer mainly the design 3 (36,4%) instead of the others, namely design 2 (14,7%) and design 5 with only 6,2% of the answers.

After we had revealed the brands behind the designs, we noticed a slight difference on the responders’ preference. In this second analysis, although there was not any change about the female consumer’s preference concerning the first one (*Red Oak*) and third one (*Lanidor*) owed to fact that she knew the brand, the same did not happened with the others. For instance, the *Mango’s* tunic, before the brand had been known, was in the second position in the consumer’s preferences, when the brand was revealed it dropped to the last position. This may denote a kind of bad image concerning this brand. The opposite occurred with *Pinkie’s* tunic that, after the brand has been revealed, ascended from the fourth to the second position in the consumer’s preferences, i. e., consumers show some affinity that denotes a very good branding. So, we may conclude that, facing a certain piece of clothing’s design, knowing the brand may change the female consumer’s preference.

When we asked the same question, but concerning the price, the most popular tunic was *Mango’s*, for it has the second lowest price; in second place, the female consumers choose *Pinkie’s* tunic, for it has the lowest price among the five tunics. The consumers choose lastly *Lanidor’s* tunic, although it is the third more expensive one. When the same question is put about the composition of each of the displayed tunics, we see that the most chosen one is *Red Oak’s* that has a 100% cotton composition, which had already been chosen respecting the design, followed by *Mango’s* with 100% viscose. Keeping on the female public, and proceeding to the same analysis on other piece of clothing (jeans), we see, through Table 5, that, concerning the design, 28,5% of women prefer design 2, instead of other ones lie design 1 (12,3%) and design 4 with 16,9%.

Concerning brand, there were two of them which got the responders preference in the same way: *Mango* and *Pull&Bear* with 34,6%.

When questioned about their preference having been told about the price, the responders answer goes mainly (37,7%) for jeans that cost 36,90€, i. e., the second lowest price. Lastly, they prefer the most expensive, the *Levi's* ones (3,8%). In this way, we may infer that, when the price is known, the preferences on the displayed jeans do not get affected. When we analyze composition, female public chose by far jeans with 95% cotton and 5% spandex belonging to *Pull&Bear*, followed by *Quebramar* jeans with 100% cotton. So, we may conclude that, despite of the *Pull&Bear* jeans are the most preferred, the *Mango* ones are know the third choice, showing that knowing the composition of a certain piece of clothing may change the female consumer's preference. Concluding this analysis, we see that *Mango's* jeans were the most preferred ones concerning design, price and brand, but third ones respecting composition. *Red Oak's* and *Levi's* jeans are not first preference in any question.

Table 4: Buying decision process of women considering design, brand, price and composition of a tunic

	Design1	Design2	Design3	Design4	Design5
Image	 (15,5%)	 (14,7%)	 (36,4%)	 (27,1%)	 (6,2%)
Brand	Lanidor (18,0%)	Pepe Jeans (27,3%)	Red Oak (32,0%)	Mango (10,2%)	Pinkie (12,5%)
Price	59,50 € (7%)	99€ (10,1%)	69 € (24%)	39,9 € (30,2%)	17,45 € (28,7%)
Composition	100% Viscose (11,6%)	100% Silk (20,2%)	100% Cotton (31%)	100% Viscose (23,3%)	100% Polyester (14%)

Table 5: Buying decision process of women considering design, brand, price and composition of Jeans

	Design1	Design2	Design3	Design4	Design5
Image	 (12,3%)	 (28,5%)	 (24,6%)	 (16,9%)	 (17,7%)
Brand	Red Oak (10,8%)	Mango (34,6%)	Pull & Bear (34,6%)	Quebramar (16,2%)	Levi's (3,8%)
Price	49 € (14,6%)	36,90 € (37,7%)	35,95 € (31,5%)	50 € (12,3%)	79,9 € (3,8%)
Composition	100% cotton (13,1%)	100% Cotton (18,5 %)	95% cotton 5% spandex (43,1%)	100% Cotton (20%)	98% cotton 2% spandex (5,4%)

Men Buying Behaviour

As for the analysis of male consumer's preferences on "what" he buys, concerning design, brand, price and composition, we see through Table 4 that, in terms of t-shirt design, men choose design 10 (29,7% of preference), followed by design 9 (25,3%) and, after this, design 6 with 18,7% (Table 6).

Concerning the analysis of brand, we see that the most preferred t-shirt is *Red Oak's*, what agrees with the

option about design. We see that in the second place is *Pull&Bear*'s t-shirt, immediately followed by *Quebramar*'s and *Decénio*'s with the same preference percentage (16,5%). As for price, the most preferred t-shirt is still *Red Oak*'s, which, in this case, is the second cheapest one, followed by *Quebramar*'s and, next, by *Decénio*'s. As for the composition, although this aspect is not comparable, since all pieces have the same composition, may only reinforce the previous choices, for it maintains the choice on the same t-shirt, yet with a slight percentage decreasing. In second place, we have *Pull&Bear*'s, followed by *Decénio*'s.

Concluding this analysis, we see that *Red Oak*'s t-shirt was the most preferred concerning the mentioned aspects (design, brand, price and composition). As for *Pull&Bear*'s, concerning brand and price, it was the second most preferred and *Quebramar*'s was the second most preferred concerning design and composition. Both *Decénio*'s t-shirt and *Levi*'s are not the second choice in any case.

Proceeding to the analysis of male consumer's preferences on jeans and having in mind the design, brand, price and composition attributes, we see through Table 7 that the design the most preferred is design 7 with 29,7% of responders' preferences, followed by design 9 with 25,3% and, then, designs 6 and 8 with 15,4.

After displaying the same jeans, but revealing price, we see that the most preferred are the second cheapest ones: design 7 followed by designs 6 and 10 with the same percentage of preference. Thus, we see that there was a change on the previous question concerning the second place, yet design 7 still being the most preferred one on design and price.

As for brand, there is no change on preference, since design 7, the *Pull&Bear* ones, still are the responders most preferred ones (27,5%); yet, we notice that the percentage was lower. The second most voted ones came to be *Quebramar*'s jeans, that were not very far from the most voted ones' percentage, what shows that a great preference is given to brand. When the question is related with composition, although this aspect is not comparable, for it is the same composition to all pieces, may only reinforce that the most preferred jeans are *Pull&Bear*'s, followed by *Levi*'s and, then, by *Red Oak*'s.

Concluding this analysis, we notice that *Pull&Bear*'s jeans are the first choice in all questions. As for *Levi*'s jeans, they are the second most preferred ones concerning price and composition. The *Red Oak*'s are the second most preferred concerning design, and *Quebramar*'s the second most preferred concerning brand. *Springfield* jeans are not second choice in any question.

Once analyzed the consumer buying behaviour concerning "what one buys", it is also important to know "how" consumers go shopping. In this way, we notice that women go shopping by impulse (37%), and, on the contrary, men go mostly (33%) or majority (37%) by necessity. Also analyzed the circumstances of shopping, we see that, in general, consumers prefer to go shopping alone. Women, when they want to bring company, 18,5% prefer to go with a family member and 40% with a friend (male or female). As for men, the preference on going alone is astonishing (49,5%) when compared with the others. When they want to bring someone, 26,4% prefer to go with a family member and 24,2% with a friend.

Table 6: Buying decision process of men considering design, brand, price and composition of a t-shirt

Composition	100% Cotton (19,8%)	100% Cotton (13,2%)	100% Cotton (13,2%)	100% Cotton (23,1%)	100% Cotton (30,8%)

Table 7: Buying decision process of men considering design, brand, price and composition of Jeans

	Design6	Design7	Design8	Design9	Design10
Image	 (15,4%)	 (29,7%)	 (15,4%)	 (25,3%)	 (14,3%)
Brand	Levi's (20,9%)	Pull & Bear (27,5%)	Quebramar (22%)	Red Oak (15,4%)	Springfield (14,3%)
Price	59,90€ (16,5%)	39,95€ (42,9%)	46,8€ (9,9%)	75€ (14,3%)	35,95€ (16,5%)
Composition	100% Cotton (18,7%)	100% Cotton (41,8%)	100% Cotton (11%)	100% Cotton (16,5%)	100% Cotton (12,1%)

Analysing the consumer buying behaviour concerning “where” he goes shopping, we see that there are differences between men and women when choosing the stores where they prefer to go shopping (Table 8). In this way, women prefer to go to stores whose more advantageous factors are low prices, followed by product quality, and product variety; men appreciate the same criteria but on a different order, standing the quality of the product in the first place, followed by price and, thirdly, variety. It is worthy of mention the fact that both genders appreciate the store atmosphere in the fourth place. We may say in conclusion that the four most appreciated factors by the consumers when they enter in a clothing store are the same for men and for women, although they have a different order.

When questioned about the fact of feeling more tempted to look in the store for the products seen on the shop-window, most of men answers that they don't (58,2%) and, on the contrary, the majority (50,8%) of women say that they do it.

Other considered aspect to the consumer buying behaviour analysis was how frequently (when) the consumer goes shopping during the regular season and during the sales season. Results show that, during the regular season, both men and women mostly go shopping once a month, being that much more evident among men (63%) than women (57%). Yet, we also notice that also a great part (16,3%) of women go shopping more than three times a week.

Table 8: Aspects that the consumer appreciates when he goes to a store

	Women		Men	
	Average	Standard deviation	Average	Standard deviation
Price	6,10	1,003	5,64	1,070

Pieces exposed on the store's manikin	3,91	1,907	3,89	1,722

Store's decoration	3,85	2,107	4,14	1,670
Catalogue products	3,42	1,456	3,37	1,547

5. Conclusions

Concerning the investigation question arisen in this study: "What are the main differences on the clothing consumer buying behaviour according to gender?" and, since it was not rejected the hypothesis of investigation that defended the existence of differences on the consumer buying behaviour according to gender, we noticed, in what concerns "what one buys", that both men and women mostly prefer clothing that may highlight their physical attributes. Women appreciate first of all satisfaction and comfort, followed by function, while men prefer comfort, followed by satisfaction and, finally, quality.

As for "how one buys", women go shopping mostly by impulse and bring someone, while men do it by necessity and almost always alone. Respecting the question "where one buys", he prefers to buy his pieces of clothing in stores that display an appealing and pleasant atmosphere, where low prices, quality and variety are highlighted both by women and men, although in a different order. In terms of "when one buys" (how frequently one goes shopping), we may infer that women buy more often and that both genders choose to buy mostly during sales season.

There are some restrictions that may be pointed out in this study, namely the fact of not having been highlighted a stricter age rank within the population and the sample's dimension is somehow reduced.

In terms of future threads of investigation, it would be interesting to cross the gender variable with age, income level, professional occupation and also to expand the same study to more than a country.
