Trust and Loss Aversion in Romanian Capital Market

Antoniade-Ciprian ALEXANDRU, Lecturer, PhD,
The Faculty of Economic Sciences,
The Ecological University of Bucharest, Romania

Abstract
In this paper we are preoccupied by a study of trust and loss aversion on Romanian capital market. In global financial depreciation of stocks the emergent markets are much more affected that the lack of money and investors aversion. Based on efficient market theory we study the evolution of portfolio structure in balanced funds. We are interesting to make an evaluation of present sentiment of investing money in capital markets and especially in stocks. Also, is necessary to determine which are the most important problems in this situation and seek an adequate stimulus for future development of direct investment.

Keywords: portfolio structure, balanced funds, loss aversion
JEL: G11, G12, G14

Introduction

Trust is defined by Guiso, Sapienza and Zingales (2008) “as the subjective probability individuals attribute to the possibility of being cheated”. The subjective probability is partly based on objective characteristics of the financial system: the quality of information, the investor protection, stability of direct or indirect tax on revenue and also the law enforcement.

Loss aversion is possible to be financed by a higher profit, but the impact of trust on portfolio decisions is definitely one of the causes for lack participation of individuals on capital markets and especially on stocks.

In this paper we present an important set of data about evolution of Bucharest Stock Exchange Index (BET-C) like an expression of loss-aversion generated by depreciation of the stock price. BET-C index include all listed companies on stock exchange. Also we show the number fluctuation of investors in balanced funds and total net assets hold by institutional investors.

A representative image about the dynamics of investor behavior, loss-aversion and trusting sentiment is evolution of balanced funds regarding portfolio structure. For a better overview of the situation we choose a period that includes bullish and bearish market, from Feb., 2006 to Nov., 2008.

Romanian capital market overview

The Romanian capital market, in spite of the twelve years from its establishment, has not yet been able to accomplish one of its main tasks, namely that of attracting available investment funds for economy. After four years of strong appreciation of stocks, between 2003 and 2006, the global recession of the capital market, from 2008, show that the emergent capital market is more vulnerable to a big capital flow.

The investors that have not sell their stocks in the beginning of the crisis, in general, are blocked until the price is up again. So the capital market needs the new money, a fresh influx of capital from new investors or from institutional investors.

The highest value of BET-C index was 7,432.63 points, in Jul, 24 2007. To the Nov, 30, 2008 the value of the index was only 2,177.39 points, with 70.70% depreciation (Fig.1).
Fig. 1 Bucharest Exchange Trading-Composite Index, from Feb., 2006 to Nov., 2008

A second important level of BET-C index was recorded at Oct. 10, 2007 with 7,208.96 points, also very close by the maximum number of investors in balanced funds 51,364, in Dec, 2007 (Fig. 4).

The Romanian stock exchange is a heterogeneous market, with a reduced number of issuers, who belong to various sectors. In some fields of activity the number of companies is too reduced for the potential average values calculated to be representative. An example in this respect is the service sector, represented by a single issuer.

The Bucharest Stock Exchange (BSE) registered a good performance between 2000 and 2007, with an important increase of the capitalization value, from €15 billion in 2005 to over €24 billion in 2007 (Table 2). Practically, the most important years of the stock exchange, since it was set up and until the present, were the years 2004-2007.

Although the situation seems to be an optimistic one, the growth of capitalization resulted more from the appreciation of the share price of the already listed companies and less from the entry of new companies on the market.

The growth rhythm of capitalization registered a slowing down trend in the years 2005-2006, mainly due to the fact that individual ownership declined in the favour of companies controlled by groups of persons and firms, and that the level of ownership was limited to 1% of the owners’ equity of the SIF. This measure also determined a slowdown of the positive trend of the BET-FI index, which registered at the end of September 2006 an appreciation of just 2.1% compared to February in the same year.

Another measure which discouraged those investors that focused on speculative trading and capital turnover at short time intervals was represented by the implementation of the provisions of the new fiscal code, which mentions that the taxation rate of incomes obtained from investments and from the transfer of alienated real estate properties in a period shorter than one year after the acquisition date increased to 16%.

The volume of transactions with shares listed on BSE + NASDAQ had a dynamic similar to that of equity market capitalization, registering an increase of 21% in 2006 compared with an increase of 196% in 2005 and a 112% in 2004.

In absolute terms, the value of transactions in shares of listed companies increased from 8.89 billion RON in 2005 to 18.06 billion RON in 2007, that being broadly similar to those dictates price: lack of new listings to achieve fair prices for many of the "stars" stock exchange. In 2007 was recorded an increase of 68% of the volume of transactions compared to 2006, cases are few listings in November and price appreciation.

2008, against the backdrop of global financial crisis, especially the withdrawal of most foreign investors from BSE was a modest volume of transactions under the 2005 (Fig. 2 - 2008 data are presented to the month in October.).

Source: BSE+RASDAQ data series in the respective years, *) Oct.2008

Romania’s admission to the European Union on January 1, 2007 has triggered an ascending trend in the foreign capital influx on the Romanian capital market, as it results from the data of the first quarter of the year 2007.

The greatest bulk in the total volume of stock exchange transactions on the capital market performed by non-residents were those for titles issued by authorities and listed on BSE, with solely a small fraction being represented by transactions on RASDAQ.

**Stocks vs. bonds**

Before 2004, we could not say much about a bond market within the stock market exchange system because the traded amounts were insignificant. Yet the year 2006 was a very good one for the corporate bonds sector. The International Bank for Reconstruction and Development (IBRD), has certainly contributed to those favorable results by launching in September 2006 an emission of public bonds valuing 525 million RON. This operation is even more important since it is also the first issue of an international financial institution on the Romanian capital market and, further more, the first one performed on such a large scale. Due to the issuer’s credibility, the operation was a success and was quoted as AAA during the month of October. Its success is also reflected in the greater number of subscribed bonds 635,948, which show a 21% from the 525,000 allotted. Among the local bonds issues the one performed by the Romanian Commercial Bank (RCB) is an important one given its total value of 200 million lei and the fact that it has super-scribed about 21.5%.

By the value and the number of those issues, the year of 2006 ranks first on the list of traded bonds from the time the stock exchange has been created till now. The total value of the bond transactions of 281.67 million Euro, was close to the 10% entrance level of the traded shares’ turnover.

The average interest rate in RON for the corporate bonds was by the end of 2006 that of de 9.24% growing from 6.89% as recorded by the end of 2005. The municipal bonds’ average interest was of 9.84%, by the end of the year indicating a growth as compared to 8.05% in 2005. The situation is atypical for the developed capital markets due to the higher interest rates granted for the municipal bonds as compared to the corporate ones, in spite of the fact that the former present a smaller risk than the latter.
Average corporate interest was at the end of 2007 to 8.1%. The average municipal bond interest was 8.5% (compared to 9.8% in 2008 and 8.1% in 2005).

The connection between the stock exchange figures and the population’s savings is not very clear, but can constitute a clue for the drop in the natural persons’ interest for shares in 2006, a period of time when the populations’ savings, the volume of sales towards population, as well as their real estate investments have registered a slower increase.

**The balanced funds**

If loss aversion can explain reducing number of investors, this is not sufficient to explain lack of participation (Barberis, Huang and Thaler (2006)). The decision to invest in stocks requires not only an assessment of the risk-return trade-off given by historical data, but also an act of trust that the current data are reliable and the capital market system is fair.

Regarding the maximum number of investors, 51,364, the value from Nov, 2008 is 49,078, with 4.45% less (Fig.4).

**Fig.4 Number of investors in balanced funds, individuals and company, from Feb., 2006 to Nov., 2008**

The maximum value of total net assets from balanced funds was recorded Dec, 2007 at 343.57 million RON, about 95.17 million Euro, with 40% higher that Feb 2006. In that period, the trend of total net assets is correlated with number of investors and evolution of BET-C index and show that loss-aversion is important for investors on BSE (Fig.5).

Fig.5 Total net assets from balanced funds (thousand RON), from Feb., 2006 to Nov., 2008

![Graph showing total net assets from balanced funds from Feb 2006 to Nov 2008](source)

The dynamics of returns in stocks is reflected in sentiment of investors, as we see from Figure no.6. With reducing the bank interest, stability of interest at bonds and good results from stocks, the investment shift in Aug-2006 from bank deposits to quoted stock and a small increasing in bonds. A change in this trend was recorded in Jul-2008 when the professional investors have returned to bank deposits. Evolutions in other assets and T-Bills were not significant changes.

Fig.6 Portfolio structure of balanced funds, from feb, 2006 to nov, 2008

![Graph showing portfolio structure from Feb 2006 to Nov 2008](source)

If the professional investors, like those analyzed in this paper, have loss-aversion and they have “tools” for preserve most part of the profit, the other possible investors are not in faith that capital market could be an alternative for their investments.

Even for professional investor, legislative changes in the tax increase, is a key factor in lowering the attractiveness of investment in the capital. These changes may affect more or less interest to investors in shares, depending on the type of tax increase. Shareholders are directly affected by the increase of tax on dividends, as this diminishes tax earnings expected to end the current financial year. Another tax, which may affect in a quite categorically earnings expected by investors, the tax, and even if not directly affect the shareholders’ dividends, net income decreases, consequently the total amount of the dividends distributed.

**Conclusion**

The liquidity rate on the Romanian stock exchange is very low and oscillating, which determines an aversion to this market, especially in the case of foreign investors and portfolio investments strategy. Romanian capital market does not fully fulfill its role in the efficient allocation of the available capital, and the dominant aspect is the speculative character of the stock exchange.

The companies and also the population further prefer bank deposits as a form of saving or preserving their money, during the period when the bank interest rates continue decreasing trend and especially in 2008 year, after greatest depreciation of the stock prices in Romanian capital market.

The banking system has been perceived as by far less risky as the placements on the stock exchange markets, even if the gains are clearly superior on the capital market on short term, as compared to the banking system, on long term. The increased interest for the bonds and the deposits, in 2008, may fuel certain hopes for a slight amelioration in the trust for fix income instruments.

Fraud like Enron, Parmalat and FNI (a big fund of investment on Romanian capital market) may change not only the distribution of expected pay-offs, but also the fundamental trust in the system. The surveillance and control institutions must support the trust in capital market system and is necessary to reduce the fraud.
