The rich nation is the novelty, and the development that makes entire nations rich is itself the pivotal development of modern history

(Asa Briggs, British historian, 1963)

Abstract

Seen in historical perspective the main economic predicaments of the present world (such as poverty, inequality, backwardness) appear in a somewhat different light than in many current discussions. The achievements of the modern age, and in particular of the post- World War II period, are considered from the viewpoint of economic and demographic history, and in their connection with the contemporary systems of production and of international relations.

JEL Classification: P0, O10, N0.

Keywords: poverty, population, development, distribution, inequality, extraction rate, international relations, globalization, economics of war and peace, transition, colonialism, slavery, Zen economy.

1. Introduction

We live in a very unequal world plagued by poverty. Overall, economic progress is perceived as too slow, as the advance of “globalization” renders the inequalities and miseries of the world less tolerable than in the past. There is a widespread rejection in some quarters (radical economists and political scientists in particular) of the economic institutions of the modern world (identified under the garb of “capitalism” and “globalization”).¹ However, from the perspective of economic history, the present state of the world appears in a different light. A rather uncontroversial fact is that never in the history of mankind have there been so many paupers as in the present times. But the basic reason for this is that never there have been so many people around. Indeed, never in the history of the world has the percentage of (absolutely) poor people been so low. Moreover, quite recently even the absolute number of world paupers has kept decreasing. Economic inequality in the world as a whole has probably never been so high, but the reason is not, as sometimes hinted, that the lot of the poorer has worsened (“exploitation”), but the dramatic, albeit unequally distributed, economic betterment of the many. At the same time the propensity towards economic inequality (as captured by the extraction ratio, defined below) has probably never been so low in historical times. The green revolution and technological progress have contributed to decisively overcome the Malthusian trap and to bring about an impressive demographic explosion. Indeed, never in the history of the world has economic and demographic growth been so rapid as after WWII, greatly favoured by the absence of major wars,² of the sort that were endemic in the past, and by the extraordinary expansion of international exchanges. Global overall peace can be obviously attributed to the mutual threat of atomic destruction, but also to a change of perspective in international relations against the respectability of wars of aggression and conquest, leading to a change in the rules of the game that was already attempted, but utterly failed, after the first World War. The price to pay has been the lingering of the world on the brink of a global nuclear catastrophe, as well as the freezing of frontiers and national aspirations (which have surged again with a vengeance after the end of the Cold War). But Malthusian traps, and different forces leading to destabilization of relatively peaceful world coexistence (such as the inevitable diffusion of nuclear capabilities and the rise of nationalism in some quarters) are looming, with the possibility of drawing the post-war period of overall peaceful economic and demographic growth eventually to a close.

2. Poverty

Historically world population has been increasing at a very slow pace, amounting to near stagnation, held in check by high mortality rates, especially of child mortality. Per capita incomes have been mostly at what we would regard utter poverty levels, and whenever they have increased they have done so at a very slow pace, amounting, in the long run, to some

¹ For a sympathetic survey of those opinions see Zolo (2007). For a confutation of all sort of widespread anti-globalization prejudices and conventional opinions see Bhagwati, 2007. For a forceful defence of capitalist globalization see Norberg (2003).

² This means all-out wars between major military powers. Of course there was no want of “minor” conflicts (for a list of them and an estimate of their presumed victims see Balint, 1996), but for relative intensity and proportion of victims in the global world population were apparently of much lesser importance than in other epochs.

small fraction of one percent yearly. Following the industrial revolution things have started radically to change. But never have world population and world income increased so tumultuously as after the Second World War; indeed, the explosion both in wealth and population in this post-war period has been an historical unicum. Scientifically speaking, from the perspective of the history of mankind, the anomaly to be explained is not backwardness and poverty, but development and wealth. The brakes that in the previous epochs constrained the growth of world population, and which started to slacken following the Industrial Revolution,³ have apparently been swept away by the progressive lengthening in life expectancy, leading to unprecedented demographic growth, which has been accompanied by unprecedented economic growth.

Still, a large part of humanity lives in appalling poverty conditions. Indeed, there has never been such a high number of poor people in the world as in the post WWII period. If conventionally (very conventionally, indeed) we define, following the World Bank, as (absolute) poverty a daily consumption of less than two dollars,⁴ their number in 2001 was estimated as 2.7 billion,⁵ more than the entire world population in 1950.⁶ The number of extreme poor consuming less than one dollar a day in 2001 was reckoned to have been close to 1.1 billion, about the same as the entire world population in 1820 (which may be conventionally taken as the year of the coming of age of the Industrial Revolution in the UK, and of its spreading outside); the number of the extreme poor in previous years is estimated to have been even higher, about 1.5 billion around 1980 (before the recent tumultuous growth of the economy of China). Most of them are concentrated in third world countries, but a few millions are living in (and a number of them leaving from) Eastern Europe and Central Asia (the so called transition countries). See the data in the following tables:⁷

³ Or more exactly, following the scientific revolution of the sixteenth and seventeenth centuries that has led first to the Industrial Revolution and, subsequently, through the medical and public hygiene innovations it was able to conjure, to the Mortality Revolution of the second half of the nineteenth century and later, coinciding with the times of what has been dubbed the Second Industrial Revolution (cf. Easterlin, 1996, pp. 7-9, 23-29, 69 f.).

⁴ Or rather 2.15 dollars a day at 1993 purchasing power (somewhat less than 800 dollars a year), corresponding to 2 dollars of 1985 international purchasing power. According to the World Bank definition 1.08 dollars of 1993 purchasing power a day (somewhat less than 400 dollars a year), corresponding to 1 dollar at 1985 international purchasing power, characterize extreme poverty. In the text we use the colloquially usual distinction of 1 and 2 dollars a day. (For the definition of the international poverty line see World Bank, 2005, table 2.5, "Poverty", http://devdata.worldbank.org/wdi2005/Table2_5.htm#definition; see also UNPD, 2007, p. 367). Recently the World Bank has updated its definitions following a revised and extended appraisal of PPP exchange rates. We shall deal with these issues in the next section.

⁵ Source: World Bank (2005), table 2.5 "Poverty", at http://devdata.worldbank.org/wdi2005/Table2_5.htm. It should be noted that there has been actually a decrease (estimated at about 400 million) in the number of the extreme poor (less than 1\$ a day) during the 20 years from 1981 to 2001, but only because of the reduction of extreme poverty in China. Some further decrease in the amount of the less extreme poor seems to be happening in the more recent years. For some recent discussion on world poverty estimates and some updating, see Chen and Ravallion (2004) and (2007) and Ravallion, Chen and Sangraula (2007).

⁶ See Table 1. We refer to the World Bank data as the most authoritative, even by no means uncontroversial, source. The accuracy of World Bank data has been challenged in particular by Bhalla (2002) who estimates a significantly lower number of absolute poor and a much faster decrease in poverty in the two decades of accelerated globalization, between 1980 and 2000.

⁷ The figures are expressed in millions, the data are taken from World Bank, 2005, table 2.5.

2.1 Poverty and transition

It is notable that the number of the poor in transition countries as a whole has reached a peak in 1999, just a visible sign of the hardship engendered by the transition process during the nineties, but since then it has started to decrease. The same applies to the percentage of the poor in the population in transition countries, increasing, according to World Bank data, from 0.4 in 1987 to a peak of 6.3 in 1999, decreasing to 3.6 in 2001 (for those living with less than 1\$ a day); increasing from 3.3 in 1987 to a peak of 23.8 in 1999, decreasing to 19.7 in 2001 (for those living with less than 2\$ a day).

2.3 The world poor as a percentage

But on the whole the share of the poor in the human population has never been so low. According to the historical estimates reported in Bourguignon and Morrison (2002, pp. 731-732), and taking into account the number of conventional poor people in 2001, estimated by the World Bank, as well as the estimate of the size of world population in 2001, reported in table 4, the share of world population living in poverty diminishes from 94,4% in 1820 to 44% in 2001, that of those living in extreme poverty from 83,9 in 1820 down to 18% in 2001. In the end, taking into account the fact that in the period the share of the poor has been greatly reduced, the fundamental explanation of why there are so many poor people in the world is that there are so many people around. Indeed, human population has increased steadily and dramatically in the last two centuries, and in particular in the last few decades. Some relevant data are reported in table 4.

¹¹ Source: as in table 1.

Table 4¹² Human population in the course of history (in millions) ¹³

8000 BC	5
1000 BC	50
500 BC	100
1 AD	231
1000	268
1500	438
1600	556
1700	603
1750	790
1800	980
1820	1,041
1870	1,271
1913	1,791
1950	2,535
1960	3,032
1970	3,699
1980	4,451
1990	5,295
1995	5,719
2001	6,148
2005	6, 515
2008	6,641, the 1/1/2008, as projected according to the World population clock

To grasp the extent of the dramatic acceleration of population growth in recent times one may notice that the increase in population in the ten years between 1995 and 2005 (796 million) is more or less the same as that in the 10,000 years or so from the start of the agricultural revolution to the dawn of the industrial revolution (for which we may conventionally take the year 1750).

¹² The sources of the data are as follows: 8000 BC, Haub, 1995, p. 5, quoted in US Census Bureau (2007a); 1000 and 500 BC, McEvedy and Jones, 1978, pp. 342-351, quoted in US Census Bureau (2007a); 1-1700 and 1820-1913, Maddison (2006), p. 636; 1750 and 1800, United Nations, 1999; 1950-2005, United Nations, 2006, with the exception of 2001, taken from US Census Bureau 2007b. The data from 1800 in Europe, and from 1900 in the other continents are regarded, by and large, to have a fair degree of reliability. The data concerning the previous years are just estimates or, even, more or less, wild guesses. They should be considered to give an order of magnitude, rather than provide reliable data with any degree of precision (on this see Caldwell and Schindlmayr, 2002). Indeed, this applies even more to the estimates concerning national income in the tables that follow.

¹³ Looking at the first lines of the table, comparing them with the last ones, one is forced to come to terms with the fact that the momentous historical events of our distant past, recollected and magnified in history books, involved such comparatively insignificant numbers of people.

2.4 The evaluation of poverty

Of course this depends crucially on the definition of the poor. Here we use the World Bank definition, whereby the poor are defined in terms of absolute purchasing power, establishing “a realistic lower bound for the minimum ... level of consumption to meet basic human needs” (World Bank, December 2008, p. 2). This may not well correspond to a subjective, socially and environmentally conditioned, definition of poverty, in the sense of deprivation (see on this point, in particular, Kenny, 2006). Subjective deprivation may be a function of achieved living standards, and increasing expectations (cf. Easterlin, 1996, pp. 131-144). Relative poverty depends on distribution. Then there is subjective poverty that depends on habits and aspirations, where the latter increase with the diffusion, facilitated by the means of mass communication, of the consumption models of the better off. We shall be concerned only cursory with these issues. All this is perfectly true, but without a common measure one could hardly make intertemporal comparisons. Of course, in making the latter one should ideally go into detail as to the specific relevant circumstances of the various cases (possibly extending the narrative to the whole range of Sen’s capabilities). Here we may be content to note that the trends in average incomes are corroborated by comparable trends in life statistics (see below).

How are the poverty benchmarks of the World Bank at 1\$ a day and 2\$ a day set? Basically the first refers to average national poverty level of a set of the poorest countries of the world, and the second to the average national poverty level of the developing countries as a whole. Recently there has been a reevaluation of the dimension of world poverty by the World Bank, following a new expanded data base of household income and expenditure surveys, and a new comprehensive assessment of the PPP exchange rates. As a result the previous PPPs have been increased in a number of poor countries because their internal price level has been seen as higher than previously understood. A reason advanced is that the lower quality of goods consumed by the poor in poorer countries was not sufficiently accounted for.¹⁴ A new extreme poverty benchmark level has been set at 1.25 US\$ at 2005 purchasing power, and the new poverty level at 2 US\$ at 2005 purchasing power. According to the new estimates extreme poverty is more widespread than according to the old. The amount of people living in extreme poverty is estimated at 1.4 billion people, and that of those living in poverty at 2.5 billion. The percentage of the world population living in poverty has been revalued at 47%, and of those living in extreme poverty at 25%. However the dynamic aspect of world poverty has remained more or less the same, since “over 15 years global poverty fell by an average of 1 percentage point a year” (World Bank, 2008, p.1). Moreover “Global poverty measured at the \$1.25 a day line has been decreasing since the 1980s. The number of people living in extreme poverty fell from 1.9 billion in 1981 to 1.8 billion in 1990 to about 1.4 billion in 2005” (*ibidem*, p. 10). At the same time “the poverty rate for all developing countries measured at [the median poverty rate of 2 PPP\$ 2005] fell from nearly 70 percent in 1981 to 47 percent in 2005, but the number of people living on less than \$2.00 a day has remained nearly constant at 2.5 billion” (*ibidem*), less than the 2.7 billion estimated in 2001 according to the old criteria. This obviously is the consequence of the fact that the purchasing power of 2\$ in 2005 is markedly less than that of 2\$ in 1985. The criteria used for defining extreme poverty according to the new benchmarks are still the same as before—“the poverty line typical of the poorest countries of the world” establishing “a realistic lower bound for the minimum... level of

¹⁴ Cf. World Bank, 2008, pp. 3,8.

consumption to meet basic human needs” (*ibidem*, pp. 1-2). In particular, “the new extreme poverty line is set at \$1.25 a day in 2005 PPP terms, which represents the mean of the poverty lines found in the poorest 15 countries ranked by per capita consumption” (*ibidem*, p. 22). In turn \$2 a day in 2005 PPP terms represents the median poverty line for the developing countries of the world (*ibidem*, p. 10). In the present text we do not take advantage of the new evaluations, because they represent a rupture in relation the previous historical data set that reduces historical comparability (“as a result of revisions in PPP exchange rates, poverty rates for individual countries cannot be compared with poverty rates reported in earlier editions” of *World Development Indicators* (*ibidem*, p. 22)). Our focus is on history and dynamic change in the very long run, for which the old estimates are more suitable, pending a recalculation of older data using the new methodology.¹⁵

3. An unequal world

While a considerable share of the world population still lives in poverty, world income and wealth are very unequally distributed. A recent research by *Wider*, the ONU economic research centre on poverty and development¹⁶ (Davis et alii, 2006a), shows the extent of world inequality in the distribution of personal wealth:¹⁷

The 24 richer OECD countries own 83% of world private wealth (64% at PPP\$) with only 15% of world population and a per capita wealth of \$116,000 (114,000 at PPP\$). The 64 poorest countries with 40% of world population own 2% of world personal wealth (8% at PPP\$), with a per capita wealth of 1000\$ (5000 at PPP\$)¹⁸

In 2000 the 1% richest adults owned the 40% of overall private wealth (32% in PPP\$ terms)¹⁹; the richest 10%, 85%; the poorest 50%, 1% (4% in PPP\$ terms).²⁰

The Gini index of inequality of overall world wealth distribution (calculated using current exchange rates) is given as 89 (80 in PPP\$ terms)²¹, the same as that of a group of 10, where 1 has 1000, and 9, 1 each.²²

¹⁵ This is particular relevant for connecting to the historical estimates in Bourguignon and Morrison (2002), reported in table 5.

¹⁶ World Institute for Development Economics Research: <http://www.wider.unu.edu>.

¹⁷ Where personal wealth is defined as “the value of physical and financial assets less liabilities” (Davies et alii, 2006a, p. 1). The data refer to the year 2000. Methodology: “average wealth level: based on household balance sheets and wealth survey data for 38 countries (56% of the world population and 80% of wealth) extended by regression methods to most other countries region–income class averages imputed to remaining countries...distribution of wealth: based on distribution data for 20 countries wealth concentration estimated from income distribution for most other countries region–income class averages imputed to remaining countries” (Davies et alii, 2006b). The data considered refer to the year 2000, and are either measured in dollar terms at the current exchange rates or in Purchasing Power Parity dollars. It must be noted that passing from current dollars to PPP\$ reduces somewhat world inequality, since the dollar purchasing power is usually higher in poorer countries, but it does not alter substantially the global picture. It should be noted that an inquiry such as the one referred to above is based on limited data and fraught with methodological difficulties; therefore one should stress that, as is always the case with statistics, but even more in the present instance, the data should be considered to give some order of magnitude rather than to be taken at face value. For a detailed explanation of the methods used in the inquiry one may refer to the source.

¹⁸ *Ibidem*, Table 8.

¹⁹ “37% reside in the US, 27% in Japan” (Davies et alii, 2006b).

²⁰ Davies et alii, 2006a, Table 10, and Table 11a.

²¹ *Ibidem*, Table 12..

²² Davies et alii, 2006b, p. 9.

Income is distributed less unequally than wealth, but still in a markedly unequal way. According to most estimates, reported in Milanovic (2006, p. 8), the Gini coefficient of world income distribution is around 65% in the contemporary world.²³ To make a comparison, the Gini index of the distribution of family incomes of Italy is reported as 36, that of the USA 45, that of Sweden 25.²⁴ The state where the Gini index appears to be highest, among those reported in CIA's *World Factbook*, 2007 is Namibia with 71, but probably only because in other, even more unequal, third world countries no statistical data allowing its calculation are available.²⁵

Table 5. Poverty and income distribution in recent world history²⁶

year	Gini coefficient of world income distribution	Percentage of the population living in Poverty	Percentage of the population living in extreme poverty
1820	0.500	94.4	83.9
1850	0.532	92.5	81.5
1870	0.560	89.6	75.4
1890	0.588	85.7	71.7
1910	0.610	82.4	65.6
1929	0.616	75.9	56.3
1950	0.640	71.9	54.8
1960	0.635	64.3	44
1970	0.650	60.1	35.6
1980	0.657	55	31.5
1992	0.657	51.3	23.7
2001	0.657 (0.699)	44	18

3.1 Inequality between nations and inequality inside nations

From the historical viewpoint it appears that in the past (before the “great divergence”²⁷) income differences inside nations were relatively more relevant than nowadays in the determination of global inequality. In the pre-industrial world more than half of global income inequality could have been due to inequality in income distribution **inside** nations, while today the prevailing component, about 70%, is deemed to be due to differences in average per-capita incomes **between** nations (Milanovic, 2006, p. 9). On the other hand in more recent times the weight of the inside nations component seems to have somewhat increased but the trend is not uniform in the different regions of the world.²⁸ The greater

²³ The paper by Milanovic contains an interesting critical review of the different methodological approaches used to get those values.

²⁴ The Gini coefficients above are taken from CIA (2007).

²⁵ Such as in particular in Equatorial Guinea that, according to CIA (2007), has the “fourth highest per capita income in the world” but where the great bulk of the population allegedly lives in desperate conditions with less than a dollar a day (cf. also “Playboy waits for his African throne“, *Sunday Times*, 3/9/2006, available at: <http://www.timesonline.co.uk/tol/news/world/article626511.ece>).

²⁶ Data taken from Bourguignon and Morrison (2002, p. 731); the data of the last row are calculated from population data in table 4 and Word Bank poverty data. The Gini coefficient in the last row is calculated by Milanovic (December 2007) from 2002 Word Income Distribution Database. The figure between brackets refers to the recently revised set of PPP\$ exchange rates (ibidem).

²⁷ Cf. Pomeranz, 2000.

²⁸ Cf. Nel, 2006, p. 697I; IMF, 2007a, pp. 138 f.

growth rate of less developed countries as a whole should be a factor leading to the reduction of the between nations component, while increased inequality inside developed countries is a factor contributing to the increased inside world inequality component. According to the data reported in Bourguignon and Morrison (2002, p. 731) there has been an increase through time in the world Gini coefficient, from 50 in 1820 up to the present values (see table 5). Values for so far away periods seem to be rather speculative estimates, even more daring than the speculative estimates needed to arrive at an aggregate measure for the contemporary world as a whole.²⁹ But it seems plausible that the differences in income should have been lower in the past, owing to the fact that the great bulk of the population was living close to subsistence level, and given the low overall average per capita incomes. In a quite recent paper Milanovic (2009) revises the estimates of Bourguignon and Morrison, arriving at some interesting quantitative conclusions. The global Gini coefficient for 1820 is reduced to 43. The Gini coefficient measuring inequality between nations (where individual incomes inside any given nation are taken as equal to the average value) raises from 15 to 32 between 1820 and 1870, increasing up to 55-60 in the after WWII period, showing some reduction in the last twenty years due to the economic progress of China and India in particular. Between 1820 and the present times, the between countries component of the global world inequality index raises from 35 to 80-85 percent.

4. What is the source of the present high inequalities and what can we do about it

4.1 Poverty, inequality, maximum potential inequality, and the extraction rate

According to table 5, while world inequality, as measured by the Gini coefficient, has steadily increased since 1820 (an increase of the coefficient between 31% and 40% in Table 5, according to the two different estimates of the 2001 value), the proportion of paupers in the world has steadily decreased. But the changes in the world Gini coefficient are of a different order of magnitude as compared to the dramatic increase in per capita incomes.

Under very primitive conditions, when per capita incomes are close to the subsistence level, the amount of surplus the economy produces is limited, and this limits the percentage of National Income that can be appropriated by the elite, and thus the level of the maximum inequality measure (such as Gini coefficient or Theil index) that can be possibly achieved, assuming an elite dimensionally nought in relation to the whole population. As per capita levels increase, this leads to an increase in the percentage of the national product that can be accounted for as surplus, and to an increase in the maximum achievable inequality, as measured, say, by the maximum Gini coefficient compatible with the maintenance of the mass of the population at the physical subsistence level, and thus with the minimal condition assuring persistence in time of the given society.³⁰ Thus we may

²⁹ And indeed the methodological approach of the two authors appears to be particularly rough. See on this regard Milanovic, 2009, pp. 2-3; Baten et alii, 2009. On the other hand the results of the latter study, pursued through an alternative, but also rough, methodological approach confirm on the whole Bourguignon and Morrison's results.

³⁰ This assumes that the population is given. But the population itself can be seen as a function of the overall income that is allocated to supplying subsistences. If we consider the issue of surplus maximization, and that, in a Malthusian perspective, in the long run the size of population depends on the allocation of subsistencies, there is an optimal amount of population from the viewpoint of surplus maximization, which depends on resources and technology. Whenever decreasing returns set in there are two conflicting effects of population increase on the size of surplus: 1. by any given per capita surplus, more people bring about more total extractable surplus; 2. but more people decrease per capita surplus produced. If the relationship

consider as a true measure of the extent of inequality achieved by a given society not the inequality index (such as Gini coefficient) per se, but the percentage achieved of the maximum inequality index compatible with a given per capita income level. According to Milanovic (2009) and Milanovic et alii (2007) definition, this is called the inequality extraction ratio (*ier*). With the increase in world per capita income following the industrial revolution the maximum possible inequality index, which can be measured either in terms of Gini coefficient or of Theil index, obviously progressively increases, progressively approaching, in case of Gini, the 99 mark. According to Milanovic (2009, p. 18) the maximum possible world Gini coefficient increases from 56 in 1820 to 95 in 2005. As we have seen from the Bourguignon-Morrison (henceforward BM) data the actual world Gini coefficient has increased, but at lower rate. Taking the data of table 5 this means that the inequality extraction ratio decreases from $50/56=89$ in 1820 to $66/95=70$ or $70/95=74$ in 2005. However, Milanovic (2009) estimates the Gini coefficient in 1820 to the lower level of 43, and this leads to a much lower reduction in the extraction ratio between 1820 and 2005, from $43/56=77$ to 74 or 70. In terms of Theil index, however, the reduction in *ier* is much more relevant, halving from 70 in 1820 to 35 in 2005 (p. 18). Even the almost invariant Gini extraction rates however hide quite a deep change: while the inequality extraction rate inside nations has on average strongly decreased, the between nations component of inequality, and of the inequality extraction rate, had markedly increased. We may arrive therefore at the conclusion, on the basis of the degree of the decrease of inequality extraction rate inside nations, that on the whole the propensity to inequality has very much decreased, and the responsibility for the increased inequality between 1820 and present times depends entirely on the “great divergence”, the dramatic increase in the well being of the economically more advanced countries. The overall trend towards the decrease of inequality (and of the extraction ratio) inside nations could have been a consequence of the changed nature of political and economic institutions, and of greater economic and social complexity, both a cause and a consequence of modern economic growth. To some extent the extent of inequality may be a consequence of the rules of economic organization (the economic system) that allow the attainment of the given production level (as argued, with some exaggeration, by Marx, 1875: “any distribution whatever of the means of consumption is only a consequence of the distribution of the conditions of production themselves. The latter distribution, however, is a feature of the mode of production itself”). Thus it is conceivable that under real circumstances inequality could not be reduced below some level (such as measured by the Gini coefficient) without bringing about a reduction of income produced, and of its growth.³¹ At the same time too much inequality can have a negative impact on income and growth.³² One could then modify the concept of extraction

is perceived, it can affect, in theory at least, the extraction and population policy of the elite: under pre-industrial circumstances more extraction can bring about a population reduction, less extraction an increase.

³¹ “An artificially compressed distribution of income differs from the optimal distribution based on differences in talent, merit, and effort, and for this reason inhibits growth by affecting incentives, labour shirking, and free-riding behaviour” (Cornia, 2004, p. 9), where the implied optimality presumably refers to the objective of fostering growth, and perhaps to some implied social welfare function.

³² Cf. Milanovic et al. (2007, pp. 29-30): “More political power and patronage implies more inequality. The frequent claim that inequality promotes accumulation and growth does not get much support from history. On the contrary, great economic inequality has always been correlated with extreme concentration of political power, and that power has always been used to widen the income gaps through rent-seeking and rent-keeping, forces that demonstrably retard economic growth.” For the relationship of inequality and

rate as referring to the additional inequality above the minimum level compatible with the attainment of the given per capita income. Operationally we could, for instance, take the minimum level of inequality in comparable economies having similar levels of per capita income as a lower bound to the minimum amount of inequality compatible with the sustainable production of the given per capita income., and as an upper bound the maximum level of inequality in comparable economies having similar levels of per capita income. The extraction rate would then refer to the proportion of the difference between the two, concretely attained by an individual economy. The above viewpoint could anyway strengthen the conclusion that overall the rate of surplus extraction (above the minimum subsistence level) is lower nowadays than in the past, since a part of existing inequality could be seen as a necessary consequence of running a highly productive complex economic system, much more complex and productive than in the agricultural past.

Obviously one thing is inequality of incomes, another inequality of welfare. The latter is a very elusive concept, but it is what really matters. The first is at best a proxy. In considering how does income inequality translate into inequality in welfare it seems reasonable to assume decreasing utility of income, appraised for instance through “extended sympathy” (putting oneself in somebody else’s shoes).³³ And this too could strengthen the conclusion that overall the rate of surplus extraction (this time in welfare terms) has become lower.³⁴ In the end, seen in an historical context, the extent of present inequality appears not to depend on the paupers of the world being worse off, since an increasing proportion of them are progressively lifted from a state of absolute poverty, but on the fact that on the whole the lot of humans has dramatically, albeit quite unequally, improved.³⁵

4.2 Demographic explosion, economic growth and medical progress

As a consequence of the unprecedented economic progress and of the diffusion of medical and hygiene innovations from the West to the Rest of the world, the rate of growth of world population has never been so high as after WWII (see Table 6). Among the regions of the world the highest demographic growth rate has been that of Africa, the poorest region with the least economic growth.³⁶ From this it is immediately evident that the strongest factor explaining the demographic explosion is the diffusion of medical

growth, and the hypothesis that could be u-shaped (too little as well as too much inequality being adversary to growth) see Cornia et al. (2004).

³³ Moreover other considerations should be to the point: the value attributed to economic success, the life standards needed for some professionals to “function” as such, the structure of political power, the rule of law, and personal dangers as related to status.

³⁴ See Milanovic et alii (2007). An instance of a recent reverse trend signalling an increase in the rate of surplus extraction could have been the steep increase of chief executives compensations in some advanced economies, which may amount to a sort of surplus extraction engineered by collusive behaviour.

³⁵ As Milanovic (2004, p. 24) puts it: “Average income levels also set an upper boundary on inequality. ... As societies develop, income inequality has the ‘space’ to grow simply because there is a surplus which can be appropriated or redistributed among members of the society.”

³⁶ The extreme poverty rate of less than 1\$ a day in Sub-Saharan Africa is reported as 41% in IMF, October 2007b, p. 20. On the whole the post-independence economic performance of African countries (with some exceptions, notably Botswana) has been dismal: “on average, over the period 1960–2000 Africa’s population-weighted per capita annual growth of gross domestic product (GDP) was a mere 0.1%” (Collier, 2007a, p. 16763). But African economic performance has much improved since the late nineties (cf. IMF, 2007a pp. 9, f.; IMF, 2007b); in Sub-Saharan Africa, in particular, per capita growth was running, before the recent economic crisis, at about 3% a year, not a bad performance considering the very high population growth rate (World Bank, 2007, p. 3).

innovations rather than economic growth per se (which at some stage leads to reduction of natality).³⁷ The population explosion, together with the composite ethnic structure of the artificial political divisions left over from colonial times, replicated in the post-colonial state boundaries,³⁸ and the low educational attainments, contribute to explain the tensions and bloody conflicts that have engulfed that unfortunate continent.³⁹

4.3 What can be done

As to the concretely implementable measures for bringing about a more equal distribution, and reducing poverty, without affecting the unique engine of growth and welfare that has been running in the last sixty years or so of world history, there is no much clarity of thought. As is often the case, what appears at first sight, is not what really is, if one looks rationally at the implications.

4.3.1 Globalization, poverty and distribution

For instance the various proposals for limiting the extent of the liberalization of the world market, such as advocated by the various anti-WTO and trade-unions inspired movements, would probably hamper a main source of growth and economic improvement of the enterprising poor.⁴⁰ Indeed, it appears that for reducing the plight of the poor more globalization is needed, not less.⁴¹ Globalization improves the welfare of the worse off essentially because it is conducive to greater growth⁴² that spills over to the very poor.⁴³ However not necessarily globalization and growth, considering also the impact of technical

³⁷ The impact of economic growth on the Mortality Revolution, and hence on demographic growth (before fertility controls step in) is downplayed by Easterlin (1996, pp. 69-93).

³⁸ This does not mean that “natural” ethnical state boundaries would have existed anyway, given the patchwork distribution of ethnicities in the African continent. At any rate the complex ethnical structure of many African states appears to be an obstacle to development (cf. Easterly and Levine, 1997). The great success story in Africa, that of Botswana, may not be unrelated to the relatively great (for African standards) ethnic homogeneity of that country (ibidem, p. 1218).

³⁹ For a recent in-depth assessment of Africa’s economic predicaments see Collier, 2007a, and more amply, Collier 2007b.

⁴⁰ For the negative overall impact of protectionism on growth, see the quantitative inquiry in Milanovic (2005). Cf. also IMF (2007a, p. 157) for the favourable impact of international trade on the relative position of the lower quintiles.

⁴¹ For data on trade and financial globalization accompanying the high growth performance of developing economies in more recent times, especially since the nineties, see IMF (2007a, pp. 135-139). Trade globalization can be measured in terms of the increasing ratio of imports and exports to GNP, financial globalization as cross-border assets and liabilities as a ratio to GDP. Of course globalization is more than that, and includes globalization in technical knowledge, information, travel and contacts across countries, regions and continents. Technical progress in communications and transportation, together with international trade and financial liberalization, have much contributed to all aspects of globalization.

⁴² On the role of international trade and openness in conjuring development and economic progress see Dollar and Kray (2004) and the literature referred there. For a contrary, if rather unbalanced, view, see Milanovic (2003).

⁴³ “Evidence suggests that better growth is translating into declining poverty levels... for a sample of 19 low income countries, 1 percent of GDP growth was associated with a 1.3 percent fall in the rate of extreme poverty and a 0.9 percent fall in the \$2-a-day poverty rate” (World Bank, 2007, p. 3). “Across all regions, the evidence therefore suggests that in an absolute sense the poor are no worse off (except in a few post-crisis economies), and in most cases significantly better off, during the most recent phase of globalization” “over the past two decades, income growth has been positive for all quintiles in virtually all regions and all income groups” (IMF, October 2007a, p. 141).

progress, lead to an improvement of the worse off in relative terms⁴⁴ and inequality increases could contribute to offset the positive impact on welfare of the increases in real incomes.⁴⁵ As to the trend in income distribution, apparently the main culprit of recent increases in economic inequality in some areas of the planet seems to have been technological progress, by demanding skills and qualifications and substituting less skilled labour.⁴⁶ On the other hand economic “globalization” (in the sense of increase of trade and financial flows,⁴⁷ with the first having an overall equalizing, the second a disequalizing effect) appears to have had a different impact in the different areas of the world. According to IMF (2007a) economic globalization is seen to increase inequality somewhat in developed countries (because of the prevailing impact of financial liberalization, while trade liberalization is seen to exert an equalizing impact anyway⁴⁸) and decrease inequality in the less developed ones (because of the prevailing impact of trade liberalization).⁴⁹ At the same time the diffusion of technological advances all over the world is obviously itself a manifestation of “globalization” and could hardly be isolated from the other intervening factors (such as for instance financial liberalization, since foreign direct investment in particular constitutes an essential vehicle for international technological transfers).

4.3.2 Aid and transfers

As to transfers, it is hardly possible that transfers of the size needed to really bring about a significant reduction of world inequality in per capita income and wealth could be acceptable to the public opinions of better off countries;⁵⁰ in general, the propensity to aid the poor of the world is quite widespread, especially in the “development buzz ... generated by rock stars, celebrities and NGOs”⁵¹, but with somebody else’s money and resources.⁵² As a prominent example we can mention the movement for international debt

⁴⁴ Whether globalization leads to a reduction or to an increase in inequality is a contentious issue. See on this point Milanovic (2006) and the literature quoted by him.

⁴⁵ Milanovic, 2006, p. 13: “the process of globalization by itself changes the perception of one’s position, and even if globalization may raise everybody’s real income, it could exacerbate, rather than moderate, feelings of despondency and deprivation among the poor.” This could contribute to create the motivation for migrating towards more affluent countries, while increasing incomes can supply the resources for meeting the costs of migration, often a costly business in relation to the scant resources of the poorest of the earth. (On the effect that raising incomes in poorer countries such as India and China can have on increasing the emigration push towards richer ones see Bhagwati, 2007, p. 210.)

⁴⁶ Cf. IMF (2007a, pp. 139-141).

⁴⁷ This corresponds to the World Bank’s narrow definition of globalization as the “freedom and ability of individuals and firms to initiate voluntary economic transactions with residents of other countries” (cf. Milanovic, 2002, p. 3).

⁴⁸ This appears to be contrary to what is implied by the Stolper-Samuelson theorem, but it may be explained by the reduction in the price of basic wage goods imported from developing countries, in particular, and by the reduction in the relative importance of worse paid manufacturing jobs (. IMF (2007a, pp. 155-156). As to the impact of financial liberalization in increasing inequalities both in developed and in underdeveloped countries this is attributed to the fact that “higher FDI inflows have increased the demand for skilled labor, whereas outward FDI in advanced economies has reduced the demand for relatively lower-skilled workers in these countries” (ibidem, p. 159).

⁴⁹ Cf. IMF, 2007a, ch. 4, pp. 135-170.

⁵⁰ The schemes that have been proposed in regard, reviewed by Milanovic (November 2007), seem utterly unrealistic.

⁵¹ Collier, 2007b, p.4.

⁵² As a prominent historical representative of the “somebody else’s money handouts” school we may mention Jeffrey Sachs. After all it is very easy for a practicing development economist to become popular with one’s

relief, where the proponents do not appreciate that the only radical way to suppress debt is to suppress credit, while insolvency makes international debt more risky, and therefore more onerous, and this is not necessarily in the interest of poorer countries.⁵³ None of the vocal members of the debt remission campaign seems to have started an international voluntary subscription for paying off poorer countries' debt by reimbursing the creditors, or advocating that government create an international special fund for the same purpose with taxpayers' money, in order to eliminate, or reduce, the debt without worsening the credit rating of poorer debtors.⁵⁴ Nevertheless the worsening of credit rating, and the consequent reduction in the capability to borrow, of poorer debtors could have some positive side.⁵⁵ Often the debt problem arises from the propensity of populist and/or corrupt governments to overborrow for financing consumption expenditures (the onus and unpopularity of servicing the debt will then fall on future governments), or the outright siphoning out of hard currency into the foreign bank accounts of the leaders. But a worsening of credit rating could also jeopardize the ability to borrow in an emergency or an economic downturn or for financing productive investment projects. An obvious fact that is overlooked by the debt remission campaign is that whenever the funds that have been borrowed are not repaid less is available for lending to other borrowers in need, and this is especially obvious with the International Financial Institutions.⁵⁶

None of the many who deem just and natural that the pharmaceutical industry renounce exploiting the intellectual property of anti-Aids drugs, meritoriously discovered at the cost of huge investments, has proposed to start a subscription, or to pressurize governments for purchasing the corresponding patents at market value, in order to make them free for mankind, and in particular for the poorest and most affected by the disease section of world population, such as in Africa.⁵⁷ An alternative, more practical, way to overcome the issue of the excessive cost of patented drugs would be for poorer countries not to adhere to the international conventions protecting intellectual property rights, but this would put them outside the WTO, since TRIPS (Agreement on Trade Related Aspects of Intellectual Property Rights) has become a part of WTO agreements.⁵⁸ As a matter of fact

charges by generously advocating the pledging of somebody else's money. For a comprehensive criticism of past experience of aid and its bureaucratic implementation see Easterly (2006). For a hefty criticism of Easterly's standpoint, and Easterly's reply, see Sachs (2006) and Easterly (n.d).

⁵³ For the ambiguous aspects of debt relief, in particular that affecting the International Financial Institutions, see Easterly (2006), pp. 230-236.

⁵⁴ On the other hand the creation of such a special fund would bring about an obvious moral hazard problem.

⁵⁵ On this see Stiglitz, 2007, pp. 216 f.

⁵⁶ Cf. Stiglitz, 2007, p. 228: "Today, the developing countries that have repaid what was owed ... worry that debt relief is commandeering money that might otherwise have been available to them".

⁵⁷ Some feasible projects of financing private or public medical research of specific relevance for poorer countries, and insufficiently financially rewarding for unfounded private medical research, with suitable contracts allowing poorer countries taking advantage through free access of the innovations thus produced, have been proposed. This kind of schemes would have the advantage of helping poorer countries with aid expenditures bypassing corrupt and inefficient governments, helping, at the same time, the production of public goods useful for the whole of mankind. In general aid expenditure resulting in the creation of public goods that are of particular interest for poorer countries (for instance producing information or educational material) could by-pass their government and administrations and remedy at the same time the inefficiencies deriving from the insufficient provision of public goods.

⁵⁸ See the entry TRIPS in Wikipedia, and the sources listed there. [References from Wikipedia are usually shunned because of the way mistaken and inexactitudes can be incorporated (but also corrected) by everybody concerned. But a basic principle of Wikipedia is that all information should be supported by

underdeveloped countries have little to gain and much to lose from the degree of protection of intellectual property rights contemplated by TRIPS. Even if they do not comply, still a large market (that of developed countries), where intellectual rights are protected, and innovation is financed by market proceeds, would remain.⁵⁹ With the Doha Declaration (adopted in Doha, in November 2001 by the WTO Ministerial Conference) the extent of TRIPS has been attenuated, and some further development in this direction could be contemplated in future WTO negotiations.⁶⁰ In theory a possible way to reconcile the objective of maintaining revenues and incentives for intellectual production with that of helping the less developed countries could be to transfer part of development aid expenditures to national producers of intellectual public goods (preferably through some general measures such as tax rebates), while allowing to the underdeveloped economies (or some subset of them such as the poorest ones) their free utilization. The downside is that lack of protection for intellectual goods could dampen their production in the underdeveloped countries themselves; at a certain stage of their development even less developed countries may decide that protection is worth the while. In practice it is hard to expect that developed countries, and especially the USA, could allow an attenuation of the protection of intellectual goods, owing to the intensity of the lobbying by the industries concerned. Indeed, the latter have already succeeded to extend the protection to much higher levels than what appears reasonable and economically justifiable.⁶¹

As far as aid in general is concerned there is the issue of the lasting effects of the culture of dependency in perpetuating the poverty trap, by facilitating the survival of corrupt and inefficient governments, and the old saying that international aid amounts to taking away from the poor of the donor countries for giving to the rich of the receiving countries, which, in its apparent paradox, may capture a relevant aspect of international aid.⁶² What is

external sources to which one should refer for control. Moreover many articles are constantly updated and are of surprising depth and quality. I must take this opportunity to express my indebtedness to Wikipedia, one of the greatest intellectual achievements of our age, for constantly supplying a first information and direction on previously uncharted territories.]

⁵⁹ On TRIPS and intellectual property issues concerning less developed countries see Stiglitz, 2007, pp. 103-132.

⁶⁰ An issue in this respect would be competitive export of goods benefiting of lack of intellectual protection to developed economies. But this may not be insurmountable, since the developed economies could undertake far-reaching specific import controls, as they do on many commodities in general. Of more practical relevance may be the lack of actual enforcement of the discipline concerning protection of intellectual property, whatever the theoretical obligations associated to the underwriting of TRIPS, and the legal measures implemented.

⁶¹ For instance the extension of the economic protection of copyright after 50 years at least after the death of the author, contemplated by TRIPS (not to speak of the 70 years of the US or European legislation; see http://en.wikipedia.org/wiki/List_of_countries%27_copyright_length, and the sources listed there) seems hardly to be required to stimulate the production of intellectual works. How reasonable is it to expect that the motivation of an author towards intellectual creation be influenced by the economic property rights somebody else may have after his own death (not to speak 50 and more years after)? All this simply amounts to the imposition of rents for **past** production of intellectual goods, to the advantage of some who were not involved in their creation, reducing their diffusion and enjoyment, not to an incentive for future production,

⁶² According to Knack (1999) "Aid dependence can undermine institutional quality by weakening accountability, encouraging rent seeking and corruption, fomenting conflict over control of aid funds, siphoning off scarce talent from the bureaucracy, and alleviating pressures to reform inefficient policies and institutions." And "analyses of cross-country data provide evidence that higher aid levels erode the quality of governance, as measured by indexes of bureaucratic quality, corruption, and the rule of law." For the tendency of aid to benefit corrupt and undemocratic governments, see Easterly, 2006, p.133: (according to

sometimes overlooked in popular discussions is that aid usually does not directly transfer resources to the poorer of the world, since it is governments that act as representatives of the inhabitants of a country, and governments in poorer countries are often comparatively more corrupt and inefficient.⁶³ There is the damaging possibility that aid be simply wasted away and siphoned off by corrupt regimes, or, even worse, spent in armaments, feeding third world wars.⁶⁴ It is argued that aid, analogously to natural resources windfalls, weakens the determination to reform and to combat corruption and may hamper growth through the so-called Dutch disease, by increasing prices and wage costs.⁶⁵ Analogously to the rents from oil and natural resources, and even more than them, aid has been found to have a negative impact on democracy.⁶⁶ Theoretically speaking aid could aid reform and better governance through ex-ante conditionality, but, besides being strongly resented as a violation of sovereignty, and sometimes as a plot of richer countries to the detriment of aid receivers, smacking of paternalism, neo-colonialism, or even imperialism, ex-ante conditionality apparently does not work in practice, at least with respect to the poorer countries with worse governance.⁶⁷ It is also doubtful whether massive aid transfers, as proposed by some, could raise the long term growth prospects, even if they could certainly increase the short-run average incomes (but not necessarily the incomes of the poor) of the recipient countries.⁶⁸ According to Boone (1995) “Aid does not significantly increase investment and growth, nor benefit the poor”.⁶⁹ On the other hand there is a specific type of aid that the more prosperous countries are giving freely and massively, and mostly unintentionally, which mostly goes unremarked. Through the scientific progress and the technological advances they produce, they create public goods that deeply affect the economic and social fabrics of less developed countries. This is probably the fundamental explanation of the great economic and demographic advances of most less developed countries in relation to their past.⁷⁰ The same applies to the example provided by the

him “aid shifts money from being spent by the best governments in the world to being spent by the worst”). For a discussion of this issue and of the way to overcome it see Milanovic (October 2007). To his plea for taking into account, in directing aid, the degree in inequality of income distribution in the receiving countries, “penalizing countries with highly unequal distribution” one may add that the degree of inequality may be seen as an indicator of the extraction power of the elite in a receiving country, and of its power to appropriate the advantages of transfers, increasing the probability of the latter acting regressively.

⁶³ We may refer in this respect to the classification of Transparency International. An extreme case is mentioned by Collier (2007b, p. 66): only 1% of the funds spent by the Government of Chad for financing rural health clinics actually reached them. Another less extreme case relates to Uganda, where “only around 20 percent of the money that the Ministry of Finance released for primary schools, other than for teachers’ salaries, actually reached the schools” (p. 150).

⁶⁴ According to Collier (2007b, p. 103) “something around 40 percent of Africa’s military spending is inadvertently financed by aid”.

⁶⁵ Collier, 2007b, pp. 40 f. According to Collier (ibidem, p. 102) “large inflows of money without any restrictions do not seem to be well spent in many of the countries of the bottom billion.”

⁶⁶ See Djankov et alii (2006).

⁶⁷ Collier (2007b), pp. 109-110. For a consideration how aid could be tailored to really help the development of “the bottom million”, see Collier’s chapter 7, pp. 99-123.

⁶⁸ For a sceptical view on the ability of aid to raise growth of the recipient countries, see in particular Easterly, 2006, ch. 2, pp. 60-55. An argument making ethically desirable massive income transfers to the poorer countries of the world that is frequently advanced refers to the twin legacies of slave trade and colonialism. We shall return on this issue later on, in section 5..

⁶⁹ For the discussion following Boone’s controversial paper, and further interesting contributions on the issue, see Easterly (2006), pp. 45-50.

⁷⁰ See below, tables 5 to 9.

economic, social and political institutions of more developed countries, in particular to the basic idea of democracy, according to which governments should be changed by the ballot, rather than through civil strife and violent means. The latter have the fundamental disadvantage, in comparison to the ballot, to be usually much more expensive in terms of wasted economic resources, not to speak of the other, non-economic, profiles. Of course ballots serve their purpose if they are credible, this means not fundamentally rigged, otherwise sham democracy is not of much use.

4.3.3 Changing the basis of the international economic order

As to changing the basis of the international economic order from free exchange and market to supernational planned allocation and material barter, even aside from the concrete issue of its (in)feasibility, the past Comecon experience of planned material exchanges is not really enticing; the same applies to the other historical instances where barter exchange prevailed, with consequent high transaction costs and greatly reduced gains from trading. To some extent distribution is internationally, alike inside nations, a consequence of the institutions that regulate and, directly or indirectly, affect production and exchange. The institutions that may favour high levels of productivity and growth, such as the remarkable performance of the developing countries, aside from the unfortunate “bottom billion”, reaching in the last two decades of the last century the unprecedented rate of 4 per cent of per capita income growth, and even more in the first years of the new millennium,⁷¹ have some distributional consequences that only partially can be mitigated without affecting economic outcomes. Thus to radically change those institutions could be against the interest of the world poor, despite the deep injustice of a world where at least 60% of one’s position in the global personal income distribution can be explained by the accident of being born in a country instead than somewhere else, and a good deal of the rest by the accident of having been born in a family rather than in another.⁷² In reality the greatest practical opportunities for redistribution appear to lie inside countries through reform of their institutions and the political process. In lower and middle income countries, with good natural resource endowments in particular, the specific extractive nature of the institutions, enhanced by the absence of checks and balances, often leads to the formation of high incomes based on rents, whereby the resulting high degree of inequality (at a Gini coefficient of 40 and above) represents a brake to growth rather than a by-product of growth-enhancing institutions and social processes,⁷³ not to speak of the much higher risk of civil war and instability associated with “dependence upon primary commodity exports”.⁷⁴

⁷¹ Collier, 2007b, p. 8. This finds a counterpart in the transformation of trade and the economic basis, whereby actually “80 percent of developing countries exports are manufactures, and service exports are also mushrooming.” (Ibidem, p. 81.)

⁷² See Milanovic (2008). Owing to the very high relative premium of changing country in relation to the restricted probabilities of advancement by remaining in a poor country, the pressure to migrate must be very high from poorer countries, especially towards rich countries where income distribution is more egalitarian (supposing the expected destination of the migrants to be mostly in the lower distributional range of the country of immigration). In turn this may contribute to bring about a lesser egalitarian distribution in the receiving countries, because of lower propensity towards redistribution and interclass solidarity engineered by increased ethnic differentiation and the immigration pressure.

⁷³ See Nel (2006), pp. 697-698 and the literature quoted there.

⁷⁴ Collier 2007b, p. 21. According to Collier some international charter agreed among all main industrial partners requiring greater transparency in the conditions of exploitation of natural resources, and the

The most radical way to overcome this issue would be the cosmopolitan one to make of the world a single country, with the power and responsibility to decide and enact redistribution policies. One could only (idly) speculate about the kinds of institutions and economic governance such a cosmopolitan world would have. But for good or for worse humanity is divided into separate territorial states, and solidarity towards the citizens of other states is usually much weaker than solidarity towards fellow citizens, or, even more, especially where there are strong ethnic divisions inside states, towards one's own ethnic community. Moreover measures of solidarity are also the outcome of the fact that citizens, however destitute, are partaking into, and therefore have some scope for influencing through collective action, the political process, albeit with quite different degrees, according to its specific characteristics. Thus "the state is, for the time being, the only legitimate context within which relative deprivation can be addressed through redistributive policies and practices", and "it is at the level of states only that the principles of distributive justice can and may apply, as it is on this level alone that we have the institutional means to legitimately take from the rich and give to the poor". For good or for worse, people will belong to separate states for a long time to come, rather than being simply citizens of the world, and this will limit the degree of solidarity and redistribution at the world level.⁷⁵ John Lennon's utopia of *Imagine there's no countries Nothing to kill or die for -- And no religion too* is unfortunately very far off.⁷⁶

4.3.3.1 Breaking the actual international economic order with the violence of the worse off

We have seen that a suitable alternative to the basic principles of the actual international economic order and to increasing globalization does not seem to exist. As to a general process of income redistribution among the states of the world, this seems utterly unrealistic (and not necessarily productive of a substantial betterment of the situation of the worse off of the world). But let us suppose that redistribution is forced by the less developed countries through violence, analogously to what has often happened in the historical past, when the civilizations of the Middle East, South-East Asia and Europe were invaded or taken at ransom by warlike "barbaric" peoples coming down from the fringes of the civilized centre. Could a forced world redistribution through violence be achieved? Let us suppose that conquest and domination by the less developed could be achieved through the unwillingness of the more developed to resort to the means available to defend themselves (such as for instance the use of atomic power). Could this bring betterment and prosperity to the masses of the poor of the world? This seems hardly a possibility. The idea that an advanced country, whose main wealth is the stock of its human capital could be run through domination and violent coercion to the benefit of some conqueror, much poorer because endowed with much less human capital, does not seem

utilization of the rents thereof, would be of great help in improving the way in which those revenues are spent. To the obvious objection that China's unconditional scrambling for the underdeveloped world's natural resources would break any conceivable charter, Collier's rather unpersuasive counterargument is that "The West has to offer China greater inclusion in power in return for adherence to international standards." (Ibidem, p. 146.)

⁷⁵ Cf. Neal, 2006, pp.702-703.

⁷⁶ On the other hand to have peoples belonging to different sovereign constituencies ("states") can be optimal if people are clustered in groups with distinct culture and preferences (cf. on this Muller 2005), this means until "globalization" will eventually have unified culture and prevailing preferences all over the world. But even in this case some technical problems of managing very large constituencies could lead to the optimal subdivision of the world into distinct sovereign states.

realistic.⁷⁷ And it seems also unrealistic that under some hypothetical circumstances the ruling elite of the conquering state would exert its exploitation of the conquered to the benefit of the poor of their state rather than of itself. We shall return later on these issues

4.3.4 The problem of the “fragile” states

A related problem to which no easy solution can be seen is that of the so-called fragile states, “countries with particularly weak governance, institutions, and capacity...often in conflict”⁷⁸ (where either internal or external conflicts are often at the origin of “fragility”), which did not partake of recent world economic growth, and are plagued by particularly severe problems of extreme poverty, high child mortality, and illiteracy. Short of neo-colonialist endeavours, which could hardly be a choice, the only way seems to hope that, favoured by the impact of globalization and institutional imitation, and possibly through the help of the international community, their internal dynamics could evolve so as to bring about a more favourable environment, in particular through the overcoming of the violent conflicts often at the origin of “fragility”. Indeed, as argued by Collier (2007b, p. 31), a greater participation in peace keeping by the international community, in order to reduce the probability to conflict reversion, could be the best form of aid. As to peace enforcing, and nation and institution building, this is a much more tricky issue, because of its neo-colonialist connotations and implied violation of national sovereignty, lack of consensus by the international community, and lack of volunteers to offer the needed resources and face the inevitable losses and expenditures. The history of humanity is a long history of horrors. We surely cannot do anything about the horrors of the past. Probably we cannot do much about the horrors of the future. Only a delirium of omnipotence can lead us to believe that we should be able to deal with all the horrors of the present. We may just be left with the solution of ending the patronizing approach,⁷⁹ leaving fragile states to do their own experiences, as everybody else has done in the past, and learn through generations how to progress, forming and changing their own institutions. But our world has become much more impatient with historical time, the perceptions of contemporary horrors is enhanced by the spread of information and of visual representation all over the world, and we have become used to the idea that, by resorting to appropriate techniques, reforms, and interventions, we could solve all human and social problems. Moreover a country’s internal disturbances may severely impact on its neighbours, not only as a consequence of the collapse of trade following the collapse of the economy, but especially by originating massive sudden migrations, and by the spreading abroad of internal disturbances, as well as diseases.⁸⁰ We may just remind the disastrous consequences of Ruanda’s internal conflicts on Congo/Zaire or, quite recently, of Mugabe’s autocratic follies for the internal peace of South Africa, and of the internal conflict and absence of a state in Somalia for the safety of sea routes. A paradigmatic case is the massive influx of refugees (estimated at 11 million) from Bangladesh to India after the Pakistan military repression in 1971, amounting to “demographic aggression”, and prompting the Indian intervention in the conflict, resulting in Bangladesh independence.⁸¹ The consequences of failed states on the outside world can

⁷⁷ See Simon (1989), p. 175.

⁷⁸ World Bank (2007, pp. 2-3).

⁷⁹ The latter is exposed and lamented by Easterly, and others (cf. Easterly, 2006, pp. 26-27).

⁸⁰ Cf. Collier, 2007b, p. 31.

⁸¹ Cf. Marwah, 1979, p. 560.

be indeed very severe, even if only the economically measurable aspects are taken into consideration.⁸²

4.3.5 Migration

A way to mitigate the plight of the worse off as well as of remedying the injustice of the strict interrelation of one's place of birth and one's life prospects that has been mentioned before could be to allow unrestricted immigration from the poorer to the richer countries. Considering that the prospect that improving one's lot in a poorer country is bound to be much greater through emigration than through internal advancement (as we have seen the one's lifetime income depends at least for the 60% of the country of residence) and the huge differences in per capita incomes and living standards, we may just easily understand that the pressure towards immigration in the richer countries appears almost irresistible. Taking into account the overall number of the world poor, one can appreciate the enormous migratory potential towards the more prosperous (or even the less poor) countries in a shrinking world, with potential far-reaching social and political consequences. Countries of emigration can at the same time become countries of immigration from even poorer countries, such as notably in the case of Eastern Europe as a whole, or of North Africa.⁸³ In the usual model of international trade free migration leads to greater efficiency (in the sense of the principle of compensation), but the political and social consequences in the immigration countries of unrestricted migration, which could deeply affect the social fabric, and thus the conditions of production, investment, and exchange, are not considered. At present those who succeed in reaching the heavens of a the richer country have at least a heaven where to turn on. If present world heavens were reduced to hell, reproducing the illnesses of the countries from which people are flying, there would no heaven for anybody and trade and other interaction opportunities would be negatively affected. Indeed, in case the costs of immigration were drastically reduced by abolishing the administrative constraints, as seemingly advocated by Bhagwati,⁸⁴ and more or less explicitly by many others,⁸⁵ this would bring about as a logical consequence that the migration flows would intensify up to the point where the worse off in the better off countries would be about as bad off as the worse off in the worst off countries. The consequences in the richer countries could be disastrous for equality and social cohesion, possibly leading to the same degree of ethnic violence plaguing the most unfortunate of the developing countries, with negative economic consequences, which could reverberate disastrously on the poorer countries themselves.⁸⁶ But such an outcome is rather theoretical. After all, no country in the world does admit free immigration. As Bhagwati

⁸² According to a rough estimate by Collier (2007b, p.103) the "costs of a typical civil war" are around \$ 64 billion. Collier's quantitative analysis, as well his favourable attitude to peace keeping and peace enforcement, are severely criticized by Easterly (2007), according to whom "If Collier's statistical analysis does not hold up under scrutiny, unfortunately, then his recommendations are not a reliable guide for deploying foreign aid, technical assistance, or armies. Economists should not be allowed to play games with statistics, much less with guns" (p. 1476).

⁸³ On South-South migrations see Hujo and Piper, 2007.

⁸⁴ Bhagwati, 2007, pp. 217-218.

⁸⁵ Quite often whatever limitation to immigration flows is blamed for its unsavoury (and to some extent inevitable) humanitarian consequences, without explicitly advocating free immigration. But to criticize any limitation to immigration flows logically amounts to the advocacy of unlimited immigration.

⁸⁶ For a discussion of the issue of what the consequences of unrestricted immigration would be, see Chilosi, 2002.

himself reminds us (2007. p. 218) “immigration restrictions are the flip side of sovereignty”.

Some relief could be derived by the degree of migration that the richer countries are accepting to have. But the consequences of migration for those left in the poorer countries are by no means straightforward. On the one hand there are the advantages of the remittals, and the lower demographic pressure on scarce natural resources and the environment, on the other the potentially huge losses of human capital.

5. Soul-searching and self-bashing

Tied to the issue of the evaluation of the present economic order is the issue of the historical responsibility of the West in the plight of the Rest. Overall the impact of the West has been mixed.⁸⁷ On the one hand it has played with greater efficiency, owing to its recent technological superiority, the same deadly games played by most of humanity for most of the time. On the other it has spread modern social and technological innovations, with dramatic long-run consequences in terms of improvement of the economic and living standards of most of the Rest. It has also spread its germs, with a deadly impact for some populations, in particular in South America.⁸⁸ But in the historical interaction of peoples it is difficult to do cherry-picking: the same technological and organizational dominance that has made the West deadly for some has brought about the improvement of the living standards of the many through almost universal imitation.

How much are the plight of poorer countries and the affluence of richer ones due to colonialism? And how much is the misery of Africa in particular a consequence of the transatlantic slave trade? How much does the responsibility of the latter fall on European shoulders?

5.1 Colonialism

Branko Milanovic has recently produced an interesting inquiry into the first issue (Milanovic, 2005). According to his quantitative analysis on a large historical statistical data base, colonialism has not appreciably helped nor damaged on balance the economic development either of colonial powers or of colonies. This is consistent with the fact that “colonies accounted for only a minor share of the trade and investment of developed countries in the nineteenth century, and most of the greatly expanded world trade and investment was carried on within the developed bloc itself” (Easterlin, 1996, p 2). “In the half century before World War I the market for developed countries’ exports were chiefly in other developed countries, and the principal suppliers of primary products requirements of the developed countries were other developed countries...Considering Great Britain, France, and Germany together, on the eve of World War II, their own Third World colonies accounted for only 11 percent of their merchandise trade and 12 percent of their foreign investment” (ibidem, p. 43).⁸⁹ One must also consider that the advantages of empire, the exploitation of the colonies to the benefit of the metropolis, must be balanced with the costs of empire, military, human, administrative, and of infrastructural investment. Milanovic study confirms Bairoch’s view concerning the lack of noticeable positive

⁸⁷ For a concise assessment of the mixed impact of the West on the Rest, cf. Woodruff, 1983 [1966], the “Epilogue”, pp. 335-341.

⁸⁸ See Woodruff, 1983 [1966], p. 340; Diamond (1997).

⁸⁹ Cf. also Bairoch, 1997, pp. 675-678.

consequences of colonial empires on the economic development of the metropolis. Indeed, as Bairoch remarks (p. 673), if one looks at the growth performance of European countries in the nineteenth and twentieth centuries those who grew the most were the countries without colonies, and this applies even more to the USA (p. 674). As far as colonies are concerned, Milanovic's inquiry considers the growth performance of former colonies before and after independence, in relation to that of the rest of the world, and no particular change is detected after independence. An interpretation could be that on average an exploitative structure is substituted to another. One is left then with the question whether the responsibility for accommodating the country along an exploitative path could be attributed to the colonial rule itself. According to Bairoch (p. 665) the economic development of the colonies was damaged by an exploitative "colonial pact" to the benefit of the metropolis (pp. 665-668). One is however somewhat puzzled by the fact that this "pact", hindering the development of manufacturing industry in the colonies, applied also to the colonies of European settlement (p. 667): it does not seem that the development of the "Western Offshoots" did suffer because of this in the long-run, as purportedly happened to the third world colonies. In a sense this is an issue of counterfactuals: what would have happened if there had been no colonial rule. Perhaps the only way to answer this question is to look at the different performance of countries and territories that were not subjected to colonial rule vs. those that were subjected. Unfortunately the sample of the latter is rather limited. May be it could be enriched including those territories that were independent since long (say Haiti or Liberia) to be compared with those that achieved independence since the 1960s. Perhaps the only obvious conclusion that can be reached is that the colonial territories that were subjected to massive population transfers from Europe (the "Western Offshoots") fared even better than the metropolis, while those populations that, because of remoteness or inhospitable territories, were immune to a great extent to the colonial encroachment continued their ancient modes of living, with all its advantages and disadvantages. Some additional casual remarks may be in place: Thailand, that remained independent, fared rather well in the long run, but no better than their previously colonized neighbours, such as South Korea or Taiwan or Malaysia. Japan, that underwent the near-colonial shock of Commodore Perry's intrusion fared very well and became a powerful industrial country, part itself of the world of colonizers. Haiti, that was independent since the beginning of the nineteenth century, fared badly, much worse than other Caribbean nations which gained independence more recently. Of course, even in the more favourable cases, colonization, aside from the distasteful aspects of foreign domination, leads to a deep intrusion in the very identity of the colonized peoples. But to the same analogous intrusion and estrangement from their traditional heritage leads also the globalization of our times. When one refers to the responsibility of colonialism one has to deal with this kind of questions for which is not easy to produce a plausible answer: would have the countries colonized fared any better without colonial conquest? Would the alternative to colonization have been peaceful progress rather than continuous backwardness, persistent violence and frequent wars?

Moreover colonialism has a long history, much before western colonization: indeed, "colonization is a constant feature of the history of mankind."⁹⁰ All the empires of antiquity, up to the more recent Arab or Ottoman empires were colonizers before western

⁹⁰ "la colonisation est une constante de l'histoire de l'humanité. L'histoire de la colonisation se confond presque avec l'histoire universelle." (Bairoch, 1997), p. 548.

colonialism, partaking with the latter the following features (singled out by Bairoch) 1. the imposition of the civilization of the colonizers; 2. the subordination of the colonies to the interest of the metropolis; 3. ethnical and religious discrimination.⁹¹

However repulsive for our modern sensibility is the imperialist idea to conquer a militarily weaker country and rule it by force in the interest of the conqueror, the countries that were conquered and subjected to colonial domination were not usually peaceful prosperous heavens. By and large the West and the Rest were players of the same historical game, of violent territorial expansion and domination, war, plunder, and conquest, that only quite recently has been relinquished and declared illegal by most part of humanity.⁹² In the history of humanity evil has always been banal, or, even more, what we moderns consider evil was often not seen as such, or was simply cloaked under false pretensions, such as saving through conversion the souls of the infidels, as in the 1455 Papal Bull *Romanus Pontifex*, legitimizing the slave trade⁹³, or King Leopold's pretence to administer Congo for exclusive humanitarian purposes. As is often the case in what we may see as the progress of the moral awareness of humanity some activities that in an epoch are considered as legitimate, are subsequently perceived as crimes. The history of mankind is a dense collection of actions of the kind that nowadays are defined as crimes against humanity; even genocides can be extolled in sacred books as acts of pious obedience to God.⁹⁴

5.2 Slavery

Let us turn now to the specific responsibility of the West on slavery. Slavery has been practiced by humanity from time immemorial, and probably very few parts of the earth have been immune. Africa has certainly been no exception.⁹⁵ Trans-Saharan slave trade in particular was practised to a large scale before the encroachment of the Europeans, but slave trade towards Asia was also substantial.⁹⁶ With the advantage of European technology and organization, and pulled by the demand of the new plantation economies of the New World, slave trade reached from the sixteenth century onward unheard of dimensions. But in partaking blames and responsibilities one should consider that European traders were taking care (so to speak) of transport and marketing, while the actual production of slaves was the domain of the Africans themselves and, even before the transatlantic trade, the capture and trade of slaves was one of the main economic activities of Sub-Saharan Africa. If to the demerit and shame of the Europeans should be ascribed the massive extent of the transatlantic trade, to their merit and honour it must be attributed having made slave trade and slavery illegal, extending the prohibition of slavery to their colonial domains, thus bringing eventually to an end a time immemorial historical tradition of legal slavery and legal slave trade.⁹⁷

⁹¹ Bairoch, 1997, p. 549

⁹² For an outline of the history of African autochthonous kingdoms and empires and of their wars, see Collins and Burns (2007). For the usual bellicosity and extreme violence of the "peoples without history" on which colonialism encroached, see Keeley (1996).

⁹³ Maddison, 2006, p 60.

⁹⁴ Such as in the story of Saul and the Amalekites in the Bible.

⁹⁵ The oldest documentation of slavery in Africa dates back to 2900 BC (Collins and Burns, p. 202).

⁹⁶ Cf. Collins and Burns, 2007, pp. 202-247; Maddison, 2006, pp. 574-575. Hellie, 2007.

⁹⁷ Notable were in particular the British 1807 "Act for the Abolition of the Slave Trade" and the 1833 "Slavery Abolition Act". But sporadic measures for the abolition of slavery and or/slave trade were taken even before, such as the abolition of slave trade by Denmark in 1792, effective in 1803. In ancient times Cyrus the Great decreed the abolition of slavery in the Persian Empire in 539 BC, and the Chinese emperor

6. The population explosion

In a secular (or rather millennial) perspective, before the Industrial Revolution population growth was held in check by high mortality rates, which were accompanying high birth rates. The source of high mortality rates in a classical Malthusian perspective could have been the limitation in the amount of available agricultural resources, either continuously, leading to poor nutrition (and therefore to higher morbidity and premature deaths), or episodically, through famines. But there were also other forces at play.⁹⁸ First of all very high rates of child mortality, either through systematic infanticide (itself probably a function of available resources), especially of females, or as a consequences of neglect and of poor living, childbearing, and childrearing conditions. Second, possible neglect of the elders, the disabled and the infirm. Third the spread of epidemic diseases (which was favoured by overcrowding and poor living conditions in the cities of agricultural societies). Then, endemic warfare, between tribes, nations or individuals, leading to direct deaths, as well as to misdirection and destruction of the resources otherwise available for survival.⁹⁹ Still, following the improvements of agricultural technology in particular, there was some population growth at a very slow pace, slightly accelerating in time, as shown in table 6.¹⁰⁰ Later on, especially since the half of the nineteenth century, the decrease in mortality rates (a true “mortality revolution” “which has resulted in doubling or more of average life expectancy at birth”¹⁰¹ and has been the direct consequence of the diffusion of medical

Wang Mang in China at the beginning of the Christian Era. For a more comprehensive picture see Helle (2007) or *Wikipedia's* entry “Abolition of Slavery Timeline” (as of 14/9/09); for the long path leading to the legal abolition of slavery in the twentieth century, see Miers, 2003, Bairoch, 738-740, 778-782. The last countries where slavery was legally abolished were the Arab countries: Saudi Arabia in 1962, Mauritania in 1981. Illegal or semi-legal slavery unfortunately still exists in many countries (besides Miers' authoritative volume, see Bales, 2004, and *Wikipedia's* entry “Slavery in Modern Africa”(as of 14/9/09)). For the persistence of slavery in Mauritania see Amnesty International, 2002. For the place of slavery in Islam and some contemporary authoritative opinions by Islamic scholars legitimizing slavery see the entry “Islam and Slavery” of *Wikipedia* (accessed 14/9/2009) and the sources quoted there.

⁹⁸ In Malthus' own words: “The positive checks to population are extremely various, and include every cause, whether arising from vice or misery, which in any degree contributes to shorten the natural duration of human life. Under this head, therefore, may be enumerated all unwholesome occupations, severe labour and exposure to the seasons, extreme poverty, bad nursing of children, great towns, excesses of all kinds, the whole train of common diseases and epidemics, wars, plague, and famine.” Malthus 1826 [1798], I.II.9.

⁹⁹ According to Ember (1978) about 60% of the societies of hunter gatherers of which there is documentation were recorded to be at war at least once every two years. Even more drastic is the picture traced by Keeley (1996) concerning the propensity to war and violence of ancient and modern pre-historical societies (pre-historical in the sense of “peoples without written history”). As to pre-industrial civilizations it is enough to recall world and European history (for instance, considering European history immediately preceding the Industrial Revolution, in the 16th century 95% of the time there were wars involving the major European powers, 94% in the 17th and 78% in the 18th century; cf. Eloranta, 2005). For the issue of population control in pre-industrial societies, with a survey of the relevant literature, see Caldwell and Caldwell (2003).

¹⁰⁰ The relation between population growth and agricultural technology was stressed by Boserup (1965), even if in Boserup's work the causal relation was supposed to act in the contrary sense than the one implied above; the crucial element being the density of population affecting the length of fallows. However this could be the case if a complete blueprint of alternative agricultural techniques were to exist at any given time, not if alternative agricultural techniques had to be discovered, or rediscovered, in a lengthy historical process. For a critical assessment of Boserup's work, see Federico (2001). On the other hand Boserup's argument could be reinterpreted as pointing towards endogenous technological progress in agriculture being stimulated by demographic conditions (see on this Cuffaro, 2001, pp. 67 f.).

¹⁰¹ Easterlin, 1996, p. 1.

knowledge and discoveries that has followed with some delay the Industrial Revolution) has led to a much faster population growth, while the demographic consequences of two world wars and related upheavals are shown in a temporary decrease of growth rates. The post World War II period has seen an unprecedented population explosion, with some signs of abating however following increasing living standards and progresses in the technology of birth control, spreading from the more advanced countries to the lesser developed areas of the world, leading to a forecast of about 9.2 billion around the year 2050.¹⁰²

What have been the causes of the post World War II world population explosion? Essentially the reduction in mortality rates and the increase in life expectancy (see the tables in the Statistical Appendix at the end). The birth rate has on the whole decreased in the post-war period, but the increase in life expectancy has been stronger; 17 years between 1950 to 1999 in the world as a whole, more or less the same as in the first half of the twentieth century, three times more than the increase of life expectancy in the crucial eighty years of the spread of the industrial revolution, from 1820 to 1900. One may also note that all the areas of the world have partaken in the great advance in life expectancy,¹⁰³ while the present inequality in average life expectancy between the different areas (about 50% between the highest, Western Europe, and the lowest, Africa), is much lower than either in wealth or in income (see the Statistical Appendix; with respect to some other life statistics, however, the picture is more extreme). Moreover, “differences in lifetime survival rates between rich and poor countries and between rich and poor individuals within countries were much higher two centuries ago than they are now”, and “over the past century, the life span gap between poor and rich countries has narrowed dramatically” (Milanovic et alii, 2007, p. 28 and p. 24). It is interesting to note, to understand what has been accomplished in the course of the very short historical span of two centuries that the worst off in terms of life expectancy, the “Africans south of the Sahara survive a bit longer today ... (even including the impact of AIDS), than did the English in the early nineteenth century when they had the world’s longest life spans” (ibidem, p. 26). According to Bourguignon and Morrison (2002, p. 741) the inequality in world life expectancy started to decrease from the beginning of the second quarter of the 20-th century, while the inequality in per capita income distribution continued to increase. One of the reasons of the population explosion in the post WWII period lies in the impact of the Green Revolution in third world countries, such as Mexico and India, leading to the strong growth of agricultural production, as well as in the improvements in transportation.¹⁰⁴ There was no major demographic catastrophe, of the kind that in the old times were blocking demographic

¹⁰² Cf. United Nations, 2006.

¹⁰³ Cf. tables 4A and 5A.

¹⁰⁴ With the “Green Revolution” modern agricultural techniques and high productivity seeds were imported from the developed world into developing countries through organized efforts spurred first by the Rockefeller Foundation (starting from Mexico in 1944), to which the Ford Foundation later joined forces. The result was that “the adoption of High Yielding Varieties (HYVs) enormously increased the productivity of land and labor” (Federico, 2005, p. 214). For comprehensive statistical data on agricultural growth see ibidem, pp. 233 f. However in a number of areas, in particular in Africa, and Latin America, the methods of the Green Revolution have encountered fundamental organizational and environmental obstacles (on this see Cuffaro, 2001, chapters 5 and. 6, in particular pp. 117 f.). But taking into account the increasing integration of the world food market, productivity advances in some countries can have a favourable impact on the food balance in others through their effect on world supply and prices, anyway.

advance in a secular perspective.¹⁰⁵ (For some relevant demographic data we may refer to the statistical appendix at the end.)

Table 6. Yearly average rates of population growth 1-2007¹⁰⁶ (in percentages)

	1-1000	1000-1500	1500-1820	1820-1870	1870-1913	1913-1950	1950-1973	1973-2001	2001-2007

World	0.01	0.10	0.27	0.40	0.80	0.93	1.93	1.62	1.20

¹⁰⁵ Such as in the case of the Black Death. The only globally relevant demographic catastrophe in the post War II period could have been a population deficit of an undetermined (and undeterminable) few tens of millions Chinese as a consequence of the famine following Mao's Great Leap Forward: "a dip in the growth rate from 1959-1960... was due to the Great Leap Forward in China. During that time, both natural disasters and decreased agricultural output in the wake of massive social reorganization caused China's death rate to rise sharply and its fertility rate to fall by almost half" (US Census Bureau, 18/7/2007; the dip could be graphically seen in the sudden fall in the line of the population growth rate reported in the site of the [World Population Clock](#)). According to Yao (1999) the demographic deficit in the three years 1959-61 was somewhat higher than 49 million, of which about 18.5 million extra deaths and the rest lost births. Not a big difference anyway to the size of world population at the time, of about 3 billion. For other estimates one could refer to the literature quoted by Yao, in particular Peng Xizhe (1987).

¹⁰⁶ Source of the data of the last column: U.S. Census Bureau, International Data Base, at <http://www.census.gov/cgi-bin/ipc/agggen>; the remaining data are taken from Maddison (2006), p. 637. If we concentrate our attention to Eastern Europe and the former Soviet Union in the periodization of table 6 below, we can see that the highest rate of population growth in history has taken place in the years 1950-73, slightly less but still remarkable was the rate of growth of population in 1870-1913, while the low rates in the period 1914-1950 were certainly due to the impact of two world wars and of their aftermath. The negative rate of growth in the latest period can be fairly attributed to the social and economic disruptions following the fall of the communist regimes.

¹⁰⁷ USA, Canada, New Zealand, Australia.

¹⁰⁸ One may be puzzled by the acceleration of the demographic development of Africa in a period of massive slave transatlantic trade. The answer seems to lie in the fact that "although some areas of Africa were depleted by slave raiding, on balance the African population grew after the establishment of the transatlantic slave trade because of new food crops introduced from the New World, particularly manioc, corn (maize), and possibly peanuts" (Hellie, 2007). Cf. also Collins and Burns, 2007, pp. 198-199, 311 (p. 199: "The introduction of New World and Asian crops transformed many African agricultural societies, enabling them to expand into the vast unpopulated lands of the continent."); Maddison, 2006, p. 569. The demographic consequences of the new crops were somewhat compensated however by the spread of new diseases brought by the Europeans (Collins and Burns, pp. 199-200).

7. Maddison's statistical summing-up of world economic growth

Even in the poorest of continents, Africa, per capita income has strongly increased (about three times; an unprecedented performance) since the spreading to the whole world of the present mode of production that followed the industrial revolution (see Table 7). This has taken place notwithstanding the rapid population growth, which in the post World War II years has become the highest in the world (2.69% yearly in the period 1973-2001, somewhat decreased to 2,36% in the last six years; cf. Table 6).

According to Maddison's statistical account (somewhat daring, owing to the length of the historical period covered), per capita income has decreased in Western Europe during the first 1000 years of our era, from 450PP\$ to 400 (where 400 stays for the physical subsistence level), reaching a nadir around 600 AD, and then starting a very slow recovery.¹⁰⁹ In that period the rest of the world fared slightly better, per capita incomes being throughout the period somewhat higher in Africa (430 at 1AD, 425 at 1000AD), and in Asia (450 in both years), while the remaining areas were still at low subsistence level (400). Five hundred years later the world as a whole had made some modest progress (from 436 to 566). Italy was by far the richest country with 1100PPP\$, but was stagnating until the Industrial Revolution (1820). The territories that were to become the Western Offshoots were the poorest at 400, Africa had somewhat declined at 414, stagnating until the colonial conquests of the nineteenth century, China had progressed from 450 to 600, staying at that level until 1820 and declining afterwards, down to 439 in 1950, Japan also progressed reaching 737 in 1820. At the threshold of the Industrial Revolution, in 1700, the richest world country were the Netherlands with 2130, Western Europe was somewhat lower than 1000PPP\$ on average.¹¹⁰

¹⁰⁹ The data for the year 1 in Western Europe and Asia are considered implausibly low by Federico (2002, p. 115). Federico's viewpoint is consistent with Milanovic (December 2004) estimate of 840 (p. 22) or between 800 and 900 1990 PPP\$ (p. 23) as the average per capita income of the Roman empire at the times of Augustus.

¹¹⁰ For the detailed country data one is referred to Maddison (2006, p. 639).

World	445	436	566	595	615	667	875	1 525	2 111	4 091	6 049

Economic growth has been accompanied, wherever data are available, by a great reduction, in many cases almost a halving, since 1870, of labour time (Maddison, 2006, p. 347). And hence by an enormous growth of hourly labour productivity (p. 351). Notwithstanding the reduction in labour time, production per worker has greatly increased (about ten times since 1870 in Western Europe: Maddison, 2006, p. 349). Perusing the above data it becomes obvious that at the time Marx was writing *Das Kapital* no amount of redistribution could have ever brought about the dramatic improvement in the living standards of the masses that technical progress and development (“the development of productive forces”) would have brought about in less than a life-span. Thus Marx (1875) was right in downplaying the issue of distribution as such. Distribution may be important in the short-run for allowing some of the worse-off to improve their lot. In the long run for the worse off it is more important the relation between distribution, technical improvements, production and accumulation

8. The very long perspective of the world economic history according to the Malthusian viewpoint

Fig. 1 The Malthusian trap (“world economic history in one picture”), according to Gregory Clark¹¹⁵

A possible interpretation of available historical evidence is the Malthusian view. Up to the dawn of industrial revolution the great majority of humans were on the brink of physical survival. In a very long perspective there was by and large a Malthusian equilibrium between population and resources, with a very weak long run growth, amounting to near stagnation, of world population.¹¹⁶ Under such circumstances distribution of income and wealth affects in the long run the size of the population (because unequal distribution uses up resources that could allow a larger population to subsist), but not the living standards of the masses. At the same time the existence of privileged strata, which in the short run at least are somewhat out of the Malthusian trap, can affect the well being of the worse off through the externalities they generate. These could be negative (envy and the sense of relative deprivation) or positive (the hope, however slim, to be able to raise among the privileged, some identification with their interest and life experience).¹¹⁷ Their relative impact may depend, among others, on the degree of mobility in the society concerned. Religion could surrogate mobility in this world with a belief in mobility in the afterworld.

¹¹⁵ Fig. 1.1 in Clark (2007).

¹¹⁶ Clark's 2007 book is a recent representation of this viewpoint.

¹¹⁷ According to Kenny (2006), and the empirical enquires reported by him, economic and social inequalities can have a powerful negative effect on subjective measures of poverty and deprivation, so their impact in the past, when they were associated with even greater differences in status and rights than in the present times, could have been far more devastating than nowadays. Kenny also underlines the negative impact of increasing expectations and of new consumer goods on welfare or happiness. But happiness is a rather subjective matter, as is well expressed by the Italian poet Metastasio: "Se a ciascun l'interno affanno si leggesse in fronte scritto, quanti mai, che invidia fanno, ci farebbero pietà!" (If everybody's internal pain were written on their forehead, many who are envied now, would be pitied instead.) As economists, we may content ourselves of dealing with per capita incomes, but with a lot of caveats, among others of the kind argued by Kenny. On happiness and economic growth see also Easterlin, 1996, pp. 131-144.

Even in the slave society of ancient Rome slaves had some degree of hope to be liberated, and even to become affluent or, in Christian times, to earn after death, alike their rich masters, and ever more than they, the Kingdom of Heaven. Moreover the existence of some strata that were able to enjoy a surplus over subsistence could have been an engine (however very inefficient) of progress in living patterns, and an instrument for providing the resources for some to devote themselves to art, technology and science, with eventual long run benefits for average living standards, as well as cultural benefits for mankind. Moreover if a priori, under the veil of ignorance, as under Rawles' paradigm, one should have chosen two different possible societies where to live, one with a smaller population in Malthusian demographic equilibrium with inequalities, and another one with larger population in Malthusian demographic equilibrium with lower or absent inequalities, it is not quite clear that the choice would have been for the second alternative, given that to the first one, unlike the second, is associated some probability of finding oneself better off, once the veil of ignorance is dispelled, than in the egalitarian Malthusian subsistence alternative.

Other utilizations of surplus, aside from nurturing a ruling and/or parasitic elite, were for collective purposes, such as building cathedrals or waging wars, the latter possibly being in itself one of the principal instruments, through their disruptive consequences, as well as the directly inflicted deaths, of population control. The working of Malthusian limits could have affected economic progress negatively, pushing living standards down; however greater population density could have led to more advanced production techniques and modes of organization, in particular through the division of labour and increasing returns to scale.¹¹⁸ Moreover, even if the Malthusian trap had worked in the very long-run, in the shorter run there should have been long periods (such as after the Black Death) when population growth was compatible with some improvement in average living standards. Thus in the shorter run how wealth (land ownership in particular) was distributed could have made a great deal of difference for the well being of the bulk of the population. The pressure of population on resources could have been reduced by reducing the tendency to demographic growth, either by decreasing natality or by increasing mortality. Historically speaking the increase of mortality and reduction in life expectancy would first of all be based on infanticide, but also on high propensity to accidental death in later ages.

8.1 The Malthusian mechanism under pre-agricultural conditions

In particular looser or absent organized political power under pre-agricultural conditions could have made life more precarious and insecure, leading to higher adult mortality (which anyway would have been caused by such a hazardous endeavour as hunting with the available tools of the stone age), and lower pressure on resources, thus allowing higher living adult standards than in later more densely populated agricultural societies. This could be a reason explaining the apparent paradox of the alleged lower living standards in historical agricultural in relation to hunter-gatherers societies.¹¹⁹ In the latter people appear on average to be better fed and enjoy much more leisure. This can be easily explained if we consider that in principle in hunter gathering nomadic societies to hunt and collect more does not help to prevent starvation in hard times, since what is above necessities cannot be hoarded. The bottleneck to survival are the occasional times of scarcity, whenever the latter

¹¹⁸ In the development of agriculture this is stressed by Boserup (1965).

¹¹⁹ On this see Ember (1978); Diamond (1987); Caldwell and Caldwell (2003).

do not occur there is no point in hunting and foraging more than what is needed for comfortable survival, taking into account the relation between possible yield and effort, where the former is reduced by the habit of sharing. At the same time, if less is foraged now, some more may be available in the future, especially if the foragers are able to reduce competition through defence of the territory against other groups. Another method to provide for the future as a kind of insurance (because of the expectation of reciprocating) is the practice of the sharing through gifts, probably enhanced by the fact that whenever a good hunt occurs the excess over current consumption cannot be stored, and what can be stored cannot be easily defended if it arises the envy of the lesser fortunate. In turn this in primitive societies may weaken the incentive to work,¹²⁰ and at the same time may reduce the extent of the exploitation of natural resources, avoiding the “tragedy of the commons”. In agricultural societies it pays to labour all year along (even if with different intensity according to the seasons) in order to minimize the occurrence of starvation, since provisions and the increased productive capabilities of the earth as a consequence of improvements are carried on in time. So the harder and longer is labour the higher the probabilities of survival. In the end the numbers that a given territory can sustain are much higher with agriculture, but the living stiles are possibly less pleasant. The same kind of considerations could lead to a possible basic Malthusian mechanism for controlling hunter gatherers populations: the occurrence of the occasional lack of food bringing about starvation of a usually adequately fed population particularly subjected, because of the lack of carry-over, to the vagaries of environmental conditions.¹²¹ The greater the population density and the higher the pressure on resources, the higher the probability of occasional starvation to occur. In addition, a reason put forward for explaining the possibility of better living standards of hunters gatherers in relation to agriculturalists is the lower population pressure because of the more limited fertility of the former, associated with their specific life style, as well as the possible negative consequences on fertility of the increased mobility associated with situations of penury.¹²² During the Neolithic Demographic Transition, on the contrary, the apparent increase in fertility may be explained by the shift towards the sedentary life stile of agriculturalists from the previous nomadic pattern of hunters gatherers, and possibly by new opportunities for the earlier weaning of infants.¹²³

8.2 Hunters-Gatherers and the Zen Economy

According to an austere vision of the pre-agricultural societies, hunters-gatherers were in a Zen economy,¹²⁴ where, even if people were living in absolute poverty according to our metric, they were quite well off according to another, assumed Zen-like metric, where the defining condition is the abundance of leisure and the satisfaction of limited wants. Interestingly, this corresponds to the condition of foraging animals in the wild (see Winterhalder, 1993); in both cases life could be endowed with leisure but at the same time

¹²⁰ Cf. Kaplan, 2000, p. 314.

¹²¹ Cf. Kaplan, 2000, p. 311: “One of the perennial problems confronted by virtually all hunter-gatherers is not only the seasonal variation in resources, but more significantly the periodic failure of all major resources ... Unlike agriculturalists, foragers appear to be unable or unwilling to store resources in the good times to tide them over the bad times.”

¹²² Cf. Bocquet-Appel and Bahr-Yosef, 2008, p. 5.

¹²³ See Bocquet-Appel and Naji (2006). Of particular interest is the wide discussion of the whole issue, and of the specific findings of the authors, by other scholars at the end of the article.

¹²⁴ Sahlins, 1968, p. 85.

rather short and precarious. Aside from the issue of absolute poverty, in terms of relative poverty hunters-gatherers societies could have been on the whole relatively egalitarian, so that in terms of relative poverty they were rich. On the other hand not all the hunters-gatherers societies were egalitarian, for instance there were complex ones where a hierarchical organization and even slavery were present (see Fitzhugh, 2003).

The myth of the "original affluent society" and of the extent of its leisure, as well as of its pretended favourable living conditions seemed very suitable to the 1968 cultural environment where it was conceived. In more recent times a more sober reappraisal has been put forward. Kaplan (2000), in considering the living standards of one of the surviving foraging populations (the !Kung San of Southern Africa), sees rather strange to qualify as affluent "a society with a 50 percent childhood mortality rate and a life expectancy at birth of about thirty years". Part of the confusion may derive from the apparent better alimentary and health conditions shown by the bones of pre-historical hunters gatherers in relation to those of pre-historical agriculturalists.¹²⁵ The inference of a worsening of material conditions (at least as far as alimentation is concerned) with the passage to agriculture are translated into the atemporal idea of the "original affluent society", echoing the myth of an ancient blissful state of nature.

9. The take off from the Malthusian Trap, the Industrial Revolution, Socialism and Transition

Thus for almost the totality of human history affluence has been a tiny exception in a sea of misery and precarious lives. Therefore the real historical singularity that must be explained is not poverty and backwardness, but development and wealth. If the issue of relative poverty and underdevelopment arises from the economic development of the countries that have become well off rather than from some countries having made worse off in an absolute sense, it is to the development of poorer countries that one should turn for getting rid of the issue, as well as for reducing, and one day perhaps eliminating, absolute poverty. In a number of countries, particularly in Asia, the take-off has succeeded, in others, particularly in Africa, seems to have failed.

The gigantic increase in population and wealth in the last two centuries, and the very rapid (historically speaking) decrease in the proportion of the poor have been the outcome of a mode of production characterized by the systematic application of scientific principles, and the organized pursuit of scientific and technological progress, dramatically improving the living prospects of billions of men and women, as a consequence of the basic "idea of the world as open to transformation by human intervention."¹²⁶ According to conventional wisdom its ultimate sources may be found in the Renaissance and the Enlightenment, tied together by the Reformation's critical discussion of traditional received faith. Until the Soviet Revolution this mode of production took the organizational form and vehicle of transmission of the internal and international capitalist market. This does not detract anything from the role performed by the state, in particular as provider of public goods and infrastructure, but the basic principle of economic functioning has been voluntary exchange. It is on voluntary exchange, and the creation and expansion of markets, as made possible by the creation of a mercantile economy and the gradual establishment of the rule of law and clear attribution of property rights, that the success of the Industrial Revolution

¹²⁵ Cf. for instance Cohen, 1991.

¹²⁶ Giddens and Pierson, 1998, p. 94.

and its aftermath can be attributed. According to conventional wisdom in this lies the difference with other environments of the past (such as historical China or the Arab world at its apogee) where scientific progress and innovations did not translate into sustained economic and technological progress. Real socialism can be seen just as a specific variety of this mode of production whereby the fundamental aspects have been upheld through a sort of rough extension of the rational organizing principle to the whole of society, and accumulation and innovation have been organized from the centre rather than having been the outcome of the working of market forces. Eventually this daring experiment has encountered a bitter dead end, but in the process it has partaken both of the increase in population and of the increase in aggregate production. Its failure has been a comparative failure, but still its achievements in aggregate economic and life statistical terms may be seen as substantial in relation to pre-industrial epochs. If we are willing to indulge a little bit in counterfactuals, suppose that real socialism had prevailed throughout the world by way of revolution and/or military conquest, destroying the international market system in the process. It is conceivable that after the initial disruptive consequences of the change of system some process of increasing world wealth and population would have persisted anyway, at very least by way of capital accumulation and technological diffusion in the lesser developed areas. Of course there is the issue as to the extent the survival of Soviet type socialism has been helped in practice by the contemporary existence of an international capitalist economy, from which to draw technology, as well as goods (such as foodstuffs) for whose production Soviet-type socialism was utterly less proficient, and an international price system easing the difficult task of evaluating economic opportunities.¹²⁷ But let us abstract from the latter point. Would it have been enough to argue, after the suppression of capitalism, that no better system than the socialist one is possible and to ascribe to the very nature of real socialism the economic and demographic outcomes? In this respect two viewpoints seem to be equally objectionable: that a really existing, and therefore highly imperfect, system of production must be rejected because its performance is seen as defective, and another abstractly implementable system (socialism vs. capitalism) should do better; as well the opposite contention that no better system of organization (in our counterfactual example capitalism vs. Soviet-type socialism) is possible.¹²⁸ A further consideration refers to the heavy cost of transition, as borne out by life statistical data. If compared with the case of China's transition away from the Maoist system, this may exemplify the heavy toll of revolution as compared to evolution. Indeed transition in the former socialist camp has amounted to a, by and large pacific, but on the whole very disruptive, revolution led by institutional constructivism, the idea that everything can be explained by legal institutions, irrespective of the social and historical environment where these institutions are nested. One may also think in this respect of a second best theorem (as a consequence of institutional complementarity): whenever institutions from a superior environment (in the sense that on its whole it brings about superior results) are introduced

¹²⁷ Soviet-type socialism appears to have been much less proficient than capitalism in the production of consumer goods in general and in particular in the innovation of better consumer goods and better ways to satisfy consumer needs. The only innovative consumer goods developed in the socialist camp that comes to my mind is Rubrik's cube, developed in Hungary in the mid seventies. However Soviet type socialism was by all accounts no inferior to western capitalism in the production and development of military hardware. It was much less efficient and much more profligate in its utilization of energy resources and raw materials (see on this Gomulka and Rostowski, 1988).

¹²⁸ Following Demsetz (1969) economists dubb the first of the two views as Nirvana fallacy.

in an environment where the complementary institutions (which may well be of a tacit nature) are missing this can actually lead to a worsening, rather than to a betterment, of performance, until the complementary institutions are introduced, or a suitable adaptation of the overall institutional framework takes place. Of course the issue of the best strategy of transition is a complex and most debated one. A crucial factor constraining transition strategies was of course the fact that the economic and political system in the European ex-communist countries was rotten from the inside, and its credibility and social support was low, rendering a path of gradual economic reform difficult to follow.

10. Post-war development and the Malthusian trap

As we have already mentioned, a most remarkable fact is that the world has never grown so fast, as to population and wealth, as in the post World War II period.¹²⁹ We have considered the possible causes: globalization (in particular the great intensification of international trade and investment), technical progress (and the progress of medicine), originating in the European countries and Anglo-European offshoots; in particular progress in transportation and agriculture,¹³⁰ and the absence of devastating conflicts at the global level (the world has been on the brink of a nuclear global disaster, but it didn't fall into the precipice, yet).

Notwithstanding the above successes, for the world as a whole the Malthusian trap is still lurking.¹³¹ But rather than decreasing agricultural returns, as in the classical explanation, it may be here relevant the pressure on scarce natural resources,¹³² and in particular the retroaction, on development and living standards, of the possible “tragedies of the commons”, including climate change.¹³³ The industrial and demographic developments that have accompanied the present relative prosperity have taken place at the cost of world's commons, in particular at the cost of the decumulation in the span of two hundred years of huge reserves of fossil fuels, the leftovers of hundreds of millions of years of life on earth.¹³⁴ To this one may add the destruction of forests and pristine habitats, the pollution

¹²⁹ This is epitomized by the title of Easterlin 1996 book: *Growth Triumphant*.

¹³⁰ The progresses in transportation and agriculture have been of particular importance for the provision of the basic means of survival; thanks to those progresses Woodruff's speculation in the sixties that “if we are to be guided simply by statistics, then in AD 2000—i. e. in the lifetime of our children—world population will have doubled and misery and starvation will stare mankind in the face” (op. cit., p. 340) turned out to be correct only as far as population was concerned. For the remarkable performance of world agriculture in modern times, but especially in the post-second world war years, when agricultural output growth was exceeding the most exceptional growth of population, see Federico (2005, p. 19). For the role of agriculture spearheading, alongside industry, modern economic growth, see Easterlin, 1996, p.5.

¹³¹ The extent to which the Malthusian trap is lurking is however controversial. For a contrary optimistic opinion see Simon (1981). According to Simon “another birth means another mind that can help think up ways of using resources more efficiently” (Lee, 2008). On the opposite side there is a vast intellectual current renewing the Malthusian tradition, such as by Garret Hardin, Albert A. Bartlett, Paul Ehrlich, and the Club of Rome.

¹³² Downplayed by Simon (1989), who optimistically sees in technological progress favoured by an increasing population the overall dominant factor.

¹³³ According to a plausible view, very specialized life styles, such as in the contemporary world, increase population vulnerability to dramatic environmental changes; see Chu, 1998, pp. 193-194.

¹³⁴ In this perspective the long run survival and spreading to the rest of humanity of the high living standards of the most developed world crucially depend on the successful untapping of relatively clean and plentiful new sources of energy, such as nuclear energy, either in the development of its fission or even more, perhaps, in its elusive fusion form.

of air and water, and, last but not least, CO² emissions. The plunder has mostly taken place to the advantage of industrialized countries, and of countries provided with large reserves of raw materials (in particular hydrocarbons), appropriating the rents of their exploitation. On the other hand the overall balance for poorer and energy poor countries cannot be considered as negative, since in the process their average living standards (considering both per capita income and life statistics) have greatly improved all the same, as a consequence of the diffusion of the technological advances of the West, notwithstanding the colonial domination to which most of them had been subjected in the past. But as more and more countries successfully pursue the type of industrialization and economic development that has made rich the West and better off the emerging economies, the pressure on resources and the enhanced generation of externalities may exert a negative feedback elsewhere, especially on the living standards of the countries deprived of natural resources, with potential destabilizing consequences on the economy and the peace of the world.

Extrapolating historical experience, the way out the Malthusian trap could lie on the one hand in the enhancing of technological progress, and on the other in population containment, lessening the pressure on the resource base (including the world commons). Population containment could be the outcome of a voluntary process, either at the individual and family level, following the demographic pattern of reduction of natality accompanying the development of the presently more developed countries, or it may be favoured by public policy; the possible alternatives are the usual ones that have constrained the development of population in history. Once demographic developments are considered an object of policy, some delicate philosophical problems present themselves: Is it better in presence of limited resources to have many overlapping generations with short lives, or fewer generations with longer lives? How short or how long, and how many generations? How many people for each generation? Many people with low living standards, or few with higher living standards? And how low or how high?¹³⁵ In this respect one should be reminded of the old saying “more souls more joy”. *Ceteris paribus*, the larger the population the greater the number of possible originators of new ideas and discoveries, from which the progress of humanity (however conceived) ensues, and the greater the number of possible contacts and personal interactions, favouring the development of ideas.¹³⁶ At the same time there may be some trade-off between quantity and quality: a smaller better educated population could be more conducive to economic and intellectual progress than a larger uneducated one living at the margin of survival. Theoretically speaking we could also have a Simonian dynamic equilibrium whereby high population growth spurs fast technological progress, the latter higher per capita incomes, which would retroact in maintaining the momentum of technical progress and of demographic and economic growth, compensating Malthusian static decreasing returns.¹³⁷

¹³⁵ These dilemmas can be seen as brought to their extreme consequences in Asimov's utopian world of the *Foundation* series (cf. in particular Asimov, 1986): As an alternative model to the crammed world of Trantor, the capital of the Galactic Empire, where 40 billion humans live in artificial domes, we have the very sparsely populated Solaria, where the population is controlled by strict demographic planning, with few (mutated) humans living very comfortably in very large estates worked by armies of robots.

¹³⁶ Cf. Simon (1981).

¹³⁷ On the relation between population growth, technical progress, and per capita incomes see Kremer (1993).

11 The limits to population growth: natality, mortality, and catastrophes

It is obvious however that a demographic explosion such as that of the last decades cannot last forever. Carlo Cipolla (1974 [1962], p. 86) quotes “an exercise in astronomical arithmetics” by C.P. Putnam (the inventor of the first windmill generation turbine), according to which “if the [human] race had sprung from a couple living not long before agriculture was discovered—let us say 10,000 B.C.—and if its members had expanded at the rate of one per cent per year since then [which is lower than the present rate of growth of world population], the world population would form today a sphere of living flesh many thousand light years in diameter, and expanding with a radial velocity that, neglecting relativity, would be many times faster than light.”¹³⁸

A correction to the process of world overpopulation could be found in a decreasing birth rate, as a by-product of per capita income growth, and in the extension of social security systems into the countries where the survival of the elderly is otherwise dependent on family ties, as well as in the improvement and diffusion of the technology of birth control. Thus, according to Easterlin (1996), p. 112, “both theory and evidence indicate that the population explosion is a transient phase of contemporary development experience”, since in developing countries “the more rapid the Mortality Revolution, the more rapid is the transition to lower fertility”, replicating, albeit with different speed and modalities, the demographic transition of present developed countries. But can one really discount the possibility that the Mortality Revolution could intensify as a consequence of further medical discoveries after the transition to lower fertility is over, or that preferences regarding procreation could differ as a consequence of different cultural traditions in developing countries, or could change even in the developed world, altering the dynamic demographic balance? Preferences and technology cannot really be considered as given in the long-run. The forecast of a levelling out of world population around 2050 at something more than 9 billion is at most a reasonable extrapolation of present trends, but of course only those who will be there at the time will be able to judge whether it is an adequate prediction of the future.

The shape of a future long-run population equilibrium, absent a sudden demographic catastrophe, could entail a low mortality rate, a low birth rate, a long life span, and a marked increase in the average population age. Perhaps a senescent population will be less dynamic but wiser, and more endowed with experience.¹³⁹ While we can think of demographic policies affecting the size of a population at the country level (even if a country could represent an important chunk of the world population, such as China), it seems hardly possible that demographic policies could be devised and implemented at the world level (such as advocated notably by Julian Huxley¹⁴⁰) in order to take into account

¹³⁸ A more recent statement in this line, by Albert A. Bartlett, is that “the greatest shortcoming of the human race is our inability to understand the exponential function” <http://www.albartlett.org/>.

¹³⁹ On the quality advantages of a more aged labour force see Easterlin, 1996, p. 124. For the economic consequences of population aging see *ibidem*, pp. 113, f.

¹⁴⁰ Cf. Julian Huxley (1964). Huxley is rather vague however on the instruments. Apparently the main instrument of population control that he envisages is the diffusion and promotion of the technology of birth control (p. 248: “When I say a population policy, I don’t mean that anybody is going to tell how many children she may have... It means that you recognize population as major problem of national life, that you have a general aim in regard to it, and that you try to devise methods for realizing this aim. And if you have an international population policy, again it doesn’t mean dictating to backward countries or anything of that sort; it means not depriving them of the right ... to scientific information on birth-control, and it means

the important externalities that individual decisions regarding procreation have for the world as a whole.¹⁴¹ In the past demographic control, contrasting the operation of the Malthusian trap, was often ensured by custom, involving habits such as organized celibacy (as in monastic orders), repression of sexuality, and late marriages (the way out praised by Malthus himself), systematic infanticide, or belligerent habits leading to an increase of adult mortality.¹⁴² Under conditions of progressively increasing life expectancy demographic control could assume the form of some limitation to the length of life, if not explicitly and legally binding as in the dystopian world of the *10-th Victim*,¹⁴³ in the more subtle form of denying life supporting medical treatment and, possibly, the economic means of survival, to the elderly.

Of the three factors that have historically contributed to held populations in check through recurrent catastrophes: epidemic diseases, famines, and war, the impact of epidemic diseases has been greatly reduced by the progresses of medicine, and even the definitive cure or prevention through vaccination of the AIDS epidemics appears only question of time. Of course the possibility of the surfacing of some new epidemic disease, such as aviary influenza, is always possible, but only with temporarily limited consequences, until, presumably, medical research comes to grip with it. Mass starvation as a consequence of famine has been largely swept away by progresses in transportation and agricultural technique, with the possible exception of countries plagued by war and heavy internal disturbances. Even if at the moment tensions are re-surfacing on the international food market, following increased demand and the ill-advised subsidization of fuel producing crops, another agricultural revolution is in progress through the development of OGMs, which, notwithstanding misgivings and preconceived hostilities, seems essentially a foregone development. The impact of the new revolution appears more far-reaching and of potentially much greater impact than the previous one, because of the much faster process of scientific plant breeding, and the much greater potential of invention of new varieties suitable for the most various environmental conditions.¹⁴⁴ However, alike the Green Revolution, and even more than the latter, the OGMs revolution also presents problems of compatibility with the various natural and institutional environments, especially in less developed countries. Obstacles to its spreading are presented by the specific nature of its associated private property rights, and consequent hindrances to imitation of privately owned know-how.¹⁴⁵ The latter aspect could be partly overcome through internationally concerted public action, involving in particular public, instead of private, funding of research. Moreover public international funding could provide an opportunity to direct research in areas which, while privately unprofitable, may contribute to stave off humanitarian crises, and help development, of poorer countries subject to environmental degradation. All in all the potentially most destructive factor, besides some sudden environmental disaster, could eventually be war, as a consequence of the spreading of

help in regulating and controlling their increase and planning their families.”) Fictionally, there is far-reaching demographic planning in Julian’s brother’s Aldous Huxley dystopian novel *Brave New World* (1932).

¹⁴¹ A rather provocative and thought provoking discussion of the externalities generated by individual population decisions and the (un)suitability of a deliberate public policy aimed at affecting them is Friedman (1972).

¹⁴² For an account of various methods of population control in different historical and anthropological settings, see Caldwell and Caldwell (2003).

atomic technology and of international tensions building up in an increasingly overcrowded and progressively shrinking world.¹⁴⁶

12. War, peace, the Bomb, and their economic consequences

12.1 The economic consequences of war and peace in historical perspective

The game humanity played in the past, when conquest, plunder, territorial expansion and domination, slavery, torture and mass killings were respectable endeavours and part of the rules of the game, and mass murderers acquired the status of national heroes, still remembered and glorified in monuments and history books, has led on the whole to very poor results, as measured at least in terms of demographic and economic growth. However the real extent to which wars were contributing to hold in check the progress of humanity is difficult to gauge.¹⁴⁷ A strict Malthusian could object that living standards and population would have been held in check by other Malthusian factors anyway. On the other hand as an instrument of population control war was particularly wasteful. It produced destruction both of human (in particular of adult males in their productive prime, while mortality from disease or starvation affects first of all the children and the elderly) and of physical capital. It required huge resources that could be alternatively used for collective surplus creation (which could also be employed for productivity enhancement: for instance irrigation works) or for demographic enlargement. The latter could lead to economic progress, in a Boserupian perspective, or through the cultural mechanisms argued by Julian Simon. Personal trade interrelations and useful personal contacts between the belligerents are also disrupted by war, with negative consequences on the economic base and demographic sustainability of the parties concerned. According to the socio-Darwinian vision, war is seen historically as an engine of natural selection of peoples and civilizations towards the progress of humanity;¹⁴⁸ but the selection provided by war has tended to bring to the fore populations and civilizations notable for their destructive and coercive power rather than for their peaceful civilized achievements. At the same time peaceful achievements could be to some extent dependent on the ability to organize and exert some degree of coercive power: a relatively complex societal organization, such some ancient or modern empires, could be apt both to successfully wage wars and to peaceful and progressive purposes, as relative to the times. But this does not apply, for instance, to the fierce primitive hordes plundering and destroying ancient civilizations and complexly organized states. Here too the picture could change, once the hordes are settled and organize an empire on a territory that may profit of the relative stability provided by the rulers (such as in the case of the Pax Mongolica), at least until the next invasions, massacres and destruction, in an endless Penelopian weaving and destroying the thread of civilization. Whatever the reasons, until recent times the progress of humanity, both in terms of

¹⁴⁶ It is well known that overcrowding is a factor of aggressiveness in animal populations. Some tendencies of this sort could apply to human populations as well, especially if overcrowding leads to tension building processes such as massive migration flows and increasing pressure on natural resources. That demographic growth could lead to international tensions and open conflicts for getting control of natural resources is denied by Simon (1989). His arguments, pointing to induced technical progress especially in agriculture, are not really persuasive though, because he is simply assuming, extrapolating the past, the offsetting impact of induced technical progress in the future.

¹⁴⁷ For a quantitative assessment of the negative impact of war on growth in modern times, see Milanovic (2005).

¹⁴⁸ Cf. Mueller, 2009, p. 7.

population and of productive achievements, has been so slow as to amount, in our present perception of time, to stagnation, with long spans of regression.¹⁴⁹ The first millennium of the vulgar era was for Europe a lost millennium: the decadence and fall of the Roman Empire and the dislocations following the barbaric invasions left Europe worse off economically in the year 1000, at the dawn of the new Christian nations, than at the time of the birth of Jesus Christ. Real sustained progress, meaning a substantial overcoming of the Malthusian trap (or anyway, whatever the interpretation, of the near long run stagnation, according to our modern perspective, in world population and economy), had to wait until the Industrial Revolution gradually spread all over the world. But it has been the peace period after the Second World War (localized conflicts notwithstanding) that has been accompanied by the greatest acceleration in the speed of demographic and economic advance the world has ever known in its history.

Following the tragedy of two world wars the international community refuses the legitimacy of wars of aggression directed to the enlargement of national borders and the acquisition of new territories, which in the past were one of the most popular endeavours of nations and rulers and, if successful, were a source of glory and pride.¹⁵⁰ In the post-war period, in comparison with previous times, expansionary wars have been on the whole very limited, and mostly restricted to less developed countries, in most cases have been unsuccessful, a moderating factor having been the pressure exerted by the international community.¹⁵¹

12.1.1 The rationality of war

In the past a war of conquest had some rationality (as in the present world it could appear to someone a war for controlling territories endowed with natural resources, such as hydrocarbons, or having a strategic location for their transport and control) since the natural productive foundations on which to re-start a growth process were largely unaffected by catastrophic events, as the foundation of wealth and survival was agriculture.¹⁵² Moreover in ancient times plunder and enslavement of the conquered could provide further reasonable motivations (obviously looking just at the economic viewpoint).

¹⁴⁹ An exception could have occurred during the Neolithic Demographic Transition when, according to some, population growth rates of 1% and more could have taken place for a sustained span of time (see Gary Warrick's comment in Bocquet-Appel and Najit, 2006, p. 355; Bellwood, Peter and Marc Oxenham, 2008, p. 22). With no improvement of living standards, however: as we have already mentioned the common opinion is that actually living standard were lower than under the previous pre-agricultural societies, because of longer work hours, less satisfactory nutrition, greater morbidity as a consequence of higher population density.

¹⁵⁰ Waging a war of aggression, in particular, has been made an international crime in the charter of the United Nations (art. 39). It is not particularly tranquillizing however that this provision had a precedent in article 10 of the Covenant of the League of Nations but this, as well as the Kellogg-Briand pact of 1928 outlawing wars of aggression, did not prevent Nazi Germany and the Soviet Union (both signatories of the pact) attacking Poland in September 1939, thus triggering the Second World War.

¹⁵¹ Cf. Zacher (2001). For a detailed list of post-War II military events and of their territorial consequences see the table 2, "Interstate territorial aggressions, 1946–2000" (ibidem, pp. 225-228).

¹⁵² On this point see Simon (1989, pp. 170-171). This in the end was coherent with the German *Lebensraum* concept, which paradoxically came to prominence in a period in which agriculture was reducing its relative importance in favour of industry, but which also encompassed the advantageous procurement through territorial expansion, in the mindset of the autarchic economy, of primary resources useful for industrial and military purposes. Moreover under autarchy territorial expansion could be seen as a means of market expansion, a costly replacement to free international trade.

People and land were the foundations of the power of states, of the capability to defend (and to enlarge) themselves and of the extent of their surplus extraction.¹⁵³ Things appear differently with the drastic change in the economic basis and the advances in military technology. The prosperity of industrial and post-industrial countries relies on very delicate social and economic mechanisms, and a much greater surplus may be enjoyed through voluntary exchange than through conquest and enslavement (even disregarding the costs of achieving the latter). This was the point raised by Angell (1913) on the eve of the First World War, declaring its impossibility on rational economic considerations.¹⁵⁴ Eventually, the “impossible” war broke out, with catastrophic economic (not to speak of the non-economic) consequences for everybody concerned, putting a halt to the successful economic progress of the “belle époque”. War is indeed an eminently destructive endeavour, not always avoidable on the basis of strictly rational considerations. Moreover “not the facts, but men’s belief about facts, shapes their conduct”.¹⁵⁵ And rational economic considerations may not be really important in waging a war: “In sum, studies of both the direct and the indirect influence of economic factors on the causation of war indicate that they have been much less important than political ambitions, ideological convictions, technological change, legal claims, irrational psychological complexes, ignorance, and unwillingness to maintain conditions of peace in a changing world”¹⁵⁶. Once

¹⁵³ On this see Gilpin pp. 111-112. 170.

¹⁵⁴ “It is impossible for one nation to seize by force the wealth or trade of another -- to enrich itself by subjugating, or imposing its will by force on another” (Angell, 1913, p. ix). Along the same lines see also Simon (1989) and Gilpin (1981, pp. 132-133): “through specialisation and international trade an efficient state can gain more than through territorial expansion and conquests”. For a recent contrary view see Liberman, 1996. Liberman, drawing on a survey of historical cases argues that “ruthless invaders can, in fact, successfully exploit industrial societies, as least for short periods of time.” But “the balance sheets evaluated [in his book] do not consider the costs of military conquest or economic sanctions imposed by states outside the empire...Mainly because other states balance against aggressors, conquest usually leads to disaster”(p. 4). Moreover successful exploitation requires ruthless coercion and repression (p. 5). On balance, it seems quite likely that the economic benefit of free trade may be highly superior to the economic benefits of successful military conquest, even if the latter is accompanied by ruthless exploitation (in this may lie the often assumed tendency of free trade to lead to peace, while the latter instead could be jeopardized by trade barriers, which could give some justification to the merging of market through imperial conquest; see on this Liberman, 1996, p. 30, and the literature quoted there). But this is particularly true of our modern times when technological progress is particularly fast and the modern fabric of society particularly complex. One thing is to exert outside repressive control over mass production in large factories organized along tayloristic principles (such as it may have been in the historical cases considered by Liberman) under unchanging or slowly changing technology, another in the framework of modern post-industrial economies based on information technology and on sophisticated management of production and innovation, where about three quarters of National Income rely on the production of services in a context of rapid technological progress. The latter could be greatly hampered anyway by the kind of exploitative organization that Liberman is considering. It should be noted that the Liberman’s argument in support of the historical profitability of conquest is ambiguous. It refers rather to the “cumulativity” of the resources of the conquered to be used for the military power of the conquerors rather than for the economic welfare of the latter. Conquest, according to Liberman, could enhance military power through exploitation of the resources of the conquered by the conqueror government towards warlike endeavours favoured by making those resources available to the state. But trade may instead increase economic welfare, without its benefits being amenable to centralized control, especially if the opportunity for trade could be progressively enhanced by technological progress and increased productivity, while economic development, and so the growth of potential surplus, could be hampered by exploitative dominance. Thus exploitative dominance could have some attraction for authoritarian states, much less for democracies.

¹⁵⁵ Angell, 1913, p. ix.

¹⁵⁶ Wright (1968, p. 463), quoted in Simon (1989, p. 5).

Keynes wrote that practical men are usually the slaves of some defunct economists.¹⁵⁷ We could extend the concept to international politics and war: peoples are captive of the ideas and the examples, recounted and celebrated by historians, of ancient conquerors and warlike peoples, notwithstanding the change in the economic and political circumstances that should rationally lead to different modes of behaviour.¹⁵⁸ In this respect history, far from being *magistra vitae*, should be considered a time-bomb, to be handled with the utmost care.

12.2 The economic consequences of the Bomb¹⁵⁹

The economic argument against war becomes much more compelling with nuclear technology. The spreading of nuclear armaments brings about a reduction in the propensity towards armed regional conflicts. After India and Pakistan had acquired nuclear status there have been moments of acute tension, but, unlike in the past, none of these tensions has led to open war, but for the localized Kargil conflict on the Indian side of the Kashmir line of control in 1999, where the possession of nuclear weapons may have contributed to keep the conflict localized and to lead eventually to the withdraw of Pakistani forces.¹⁶⁰ Since it has become a nuclear power, Arab countries have ceased to wage open war to Israel, with the exception of the 1973 Yom Kippur War, when the Israel presumed atomic capability may have weighted heavily on the extent of American support for Israel,¹⁶¹ and on the restricted aims of the Syrian-Egyptian offensive.¹⁶² Open direct conflicts between nuclear powers have been very rare and localized, such as the Kargil conflict mentioned above, and the Soviet-Chinese Ussuri conflict in 1969. At the same time, in case of escalation of hostilities towards a global conflict between atomic powers, the consequences could be disastrous, and not only for the countries concerned. The nuclear deterrent could be used, instead than for maintaining a cold peace, as a safeguard against escalating a conventional conflict in a nuclear war. But waging a conventional war against another nuclear power under the deterrence of a nuclear umbrella, being confident that it will not escalate in a nuclear conflict could be a very dangerous game.

¹⁵⁷ “Practical men, who believe themselves to be quite exempt from any intellectual influences, are usually the slaves of some defunct economist. Madmen in authority, who hear voices in the air, are distilling their frenzy from some academic scribbler of a few years back” (Keynes, 1936, p. 383).

¹⁵⁸ This may be seen to apply to the case of the dissolution of Yugoslavia and the ensuing wars, or, more recently, to the renewed imperial ambitions of Putin’s post-Soviet Russia. But history presents innumerable cases where the conscience of the heritage of the past brought about present blunders and destruction. A textbook case, not too far away in time, is the Italian Fascists’ grotesque striving to revive the past glories of the Roman empire.

¹⁵⁹ For a survey of the debate on the consequences of the Bomb for international relations see Roth, 2007.

¹⁶⁰ CSIS, 1999.

¹⁶¹ Cf. Farr, 1999, and the literature quoted by him.

¹⁶² “Arab strategies and war aims in 1967 may have been restricted because of a fear of the Israeli ‘bomb in the basement,’ the undeclared nuclear option. The Egyptians planned to capture an eastern strip next to the Suez Canal and then hold. The Syrians did not aggressively commit more forces to battle or attempt to drive through the 1948 Jordan River border to the Israeli center. Both countries seemed not to violate Israel proper and avoided triggering one of the unstated Israeli reasons to employ nuclear weapons” (Ibidem). Even if the possession by Israel of a viable battle-ready nuclear capability was uncertain (see Roth, 2007, p. 379), the mere possibility could have been enough to restrict the scope of the attack, even if not the attack itself.

In the present world the victory in a nuclear war could be a Pyrrhic one, since the conquered territories would stay contaminated and unproductive,¹⁶³ and the wealth of the defeated would be destroyed with their physical destruction, not to speak of the losses of the victor. Until now this entirely rational consideration (as well as the fear for the enormous losses of a nuclear war) has prevented all out wars between nuclear powers. But some kind of miscalculation as to the opponent's response could precipitate a nuclear conflict. And unfortunately hate, which may be totally destructive, can provide a stronger motivation than greed. Indeed, the object of hate is in damaging or destroying the other, while greed amounts to benefiting oneself irrespective of the welfare of the others, but it does not necessarily imply their destruction. Sometimes it may even imply caring for their welfare, if their survival or collaboration is to the advantage of the greedy. In this respect we can add hate to the perspective of Simon (1989, p. 179), according to whom "Ironically, all haters of war should pray that humans are very materialistic in their motives, as compared to their devotion to their religious or cultural heritage, or even to aesthetic values, because sound calculation of the economic benefit-cost ratio of war would result in the decision not to begin a war." Historically, intrinsic favourable attitudes towards war and against peace as such were also widespread, based on war being the occasion for displaying moral virtues and for performing heroic deeds, authoritatively represented, among others, in the works of prominent philosophers, from Aristotle to Kant (before writing *Zum Ewigen Frieden*), to Nietzsche (see Mueller, 2009, p. 2). In a sense war was in the past world the most preferred sport for engaging the physical contest of communities and nations, before the invention and world diffusion of football.

12.3 The balance of power and the poison pills of the weak

The return to the old days when the balance of power was ensuring a precarious equilibrium between "conservative" and "revisionist" powers, such as seemingly aimed for presently by Russia, striving to build up a security alliance with China against the West, would entail enormous dangers: an international equilibrium based on the balance of power, rather than on basic commonly shared values (such as in the "pluralistic security community" of the West to which Russia could have become part if not for the drive towards authoritarian nationalism, or, in its words, "sovereign democracy"), may lead to war whenever the balance is altered, or is seen in the process of being altered.¹⁶⁴ Moreover, the future may bring about the impossibility of having a balance of military power because of the net economic and military dominance of some large and assertive, potentially "revisionist", and expansionist, actors, such as could be the case in future with China¹⁶⁵.

¹⁶³ But the above does not apply to the neutron bomb!

¹⁶⁴ A clear-cut example of the extreme dangers of a perceived process of alteration of the overall strategic balance between nuclear powers is provided to the Cuban missile crisis, which brought the world very close to a global nuclear catastrophe.

¹⁶⁵ China's status as a dominant power seems inevitable if the actual pace of its economic and military growth is maintained. Its nationalistic-revisionist bias, as revealed by the obsession of annexing Taiwan (since the takeover by the Communists of continental China a de facto independent country that belonged to the Chinese empire until 1895, and then a Japanese colony until 1945) by force if necessary, and the scramble for the contested partition of the oil resources of the China sea, could make its dominance a danger for world peace. According to past experience any time new international actors raise forcefully to the scene of international politics following successful economic growth, some violent adjustments of the power relations are on the agenda (cf. Easterlin, 1996, p. 6). But, optimistically, one could also envisage an alternative path, leading China to become part of a "world security community, a group among whom war

Poison pills by weaker powers, such as the potential of derailing a conventional war into a nuclear war, with terrible consequences for the stronger aggressor, even in case the weaker is defeated (what it may be called the “Samson strategy”), could in the future restrain military aggression, albeit not some kind of suicidal attacks by those motivated by hate and unrestrained by the prospects of their own destruction. But also stronger powers could be tricked in gambling from their position of strength, and their delusion could bring about untold consequences on economic and demographic progress.

13. Conclusion

Our generation has had the privilege of living in a very special period in the history of mankind. Never in history have material conditions progressed at the rate to which we have become used to in the post-war years, never have the different parts of the globe and the different populations become so close, and world population increased at a faster rate. Never have overall life statistics improved in such a substantial way. Still, an important part of humanity lives precarious lives under appalling conditions of absolute poverty, but its relative share, and in more recent times even its absolute numbers, have steadily decreased. In the continuation, and possibly the intensification, of this process may lie the hope to eventually overcome world poverty (at least in absolute terms). At the basis of those achievements there has been a system of production and of organization (whatever its specific variations in the different countries and the different times) that has put to the fore the systematic pursuit of technical progress, and its utilization in all aspects of economic life, while providing the drive and the incentives to do so. A contributing factor accompanying the greatest increase of population and living standards that the world has historically known has been the intensification and acceleration of world economic and non-economic exchanges (“globalization”). In a world characterized by “capitalist peace” and by the refusal of the autarchic tendencies of a recent past, when autarchy was preparing the ground to a disastrous war, any country takes advantage of other countries through mutually beneficial voluntary exchanges rather than looking forward to take advantage through conquest and exploitation. No alternative better foundation of international economic relations has to date been credibly proposed. But this same system has also brought about the utilization of technical progress for making increasingly more destructive the technology of warfare. For the first time in history mankind has produced the military technology that has the potential to lead to its own demise. The danger of global thermonuclear warfare has kept the world by and large at relative peace for more than sixty years, quite an unprecedented achievement that has presumably very much contributed to the overall positive results. But even if the danger appears to have decreased with the end of the Cold War, the potential for large scale destruction remains, and may increase with the spreading of nuclear technology in presence of persisting or even increasing nationalistic drives, such as by resurging old imperial powers. Traditional power politics and dangerous brinkmanship may resurface again. Sooner or later we may go back to normality, with nationalism breeding imperialism and wars of aggression, but with much enhanced capabilities for destruction. Large scale nuclear warfare is always a possibility,

is literally unthinkable” (Jervis, 2002, p. 1). The signals that China directs to the outside world are mixed. On the one hand there is the diplomatic approach of “China’s peaceful rise” aiming to create good neighbouring relations with the other South-East Asian countries, aiming to the creation of a comprehensive Free Trade Area, on the other there is the disquieting growth of its military might, whereby military expenditures grow at double digit since the nineties. (See Jamestown Foundation, 2009.)

especially with the inevitable proliferation of nuclear capabilities, with enormous risks for the survival of humanity, even short of Dr. Strangelove's Doomsday Machine. As always has been the case in history, prosperity and economic progress are by no means foregone conclusions.

STATISTICAL APPENDIX: LIFE STATISTICS

Table 1A¹⁶⁶ Yearly births per 100 population

	1820	1900	1950	1999	2007
Italy	3.9	3.3	1.94	0.93	0.85
West European Average	3.74	3.08	1.83	1	1(EU)
East European Average					0.99 ¹⁶⁷
United States	5.52	3.23	2.4	1.44	1.42
Japan	2.62	3.24	2.81	0.95	0.81
Russia	4.13	4.8	2.65	0.88	1.09
Latin American Average			4.19	2.51	
China		4.12	3.7	1.6	1.75
India		4.58	4.5	2.8	2.27
Asian Average (without Japan)			4.28	2.3	
African Average			4.92	3.9	3.8
World			3.74	2.3	2.02

Table 2A. Average Life Expectancy for Groups A and B, 1000–1999¹⁶⁸ (years at birth; average for both sexes)

	1000	1820	1900	1950	1999
Group A	24	36	46	66	78
Group B	24	24	26	44	64
World	24	26	31	49	66

¹⁶⁶ Source: Maddison, p. 32 (some of the values refer to slightly different years: see the notes in the source); for the year 2007: CIA (2007), and, for the African average, PRB (2007). The data reported in the World Factbook for 2007 range from 0.73 (Hong-Kong) to 5.0. It is notable that among the 223 countries whose data are reported, 9 of the first 10 positions belong to African countries.

¹⁶⁷ Simple average of 17 East-European countries, with values ranging from 8.8 (Bosnia) to 1.2 (Macedonia).

¹⁶⁸ Source: Maddison, p. 33. Group A: Western Europe, Western Offshoots (USA, Canada, Australia and New Zealand), and Japan, Group B is the rest of the world.

Table 3A.¹⁶⁹ Life expectancy at birth

	1820	1900	1950	2007
Italy	30	43	66	79.9
Western Europe	36	46	67	79.5
Eastern Europe				74.5
Russia	28	32	65	65.9
United States	39	47	68	78
Japan	34	44	61	82
Latin America	27	35	51	72.8
China	na	24	41	72,9
India	21	24	32	68.6
Asia	23	24	40	69
Africa	23	24	38	52,2
World	26	31	49	65.8
More developed countries				76.7
Less developed countries				64.6

Sources: Maddison, 2006, p. 32; for 2007 U.S. Census Bureau, International Data Base, at <http://www.census.gov/cgi-bin/ipc/idbagg>.

¹⁶⁹ In order to understand the implication of the data one should consider that the data concerning life expectancy are affected for pre-modern and modern backward societies by very high child mortality rates, while adult life expectancy can be much higher. For instance in a demographic regime such as in the Mopti district of Mali in 1957-58 with a total fertility rate (average number of live birth per woman) of 7.5, life expectancy was 18, but life expectancy at 20 was 48, while in another one, corresponding more or less to the demographic regime of 1650-1750 England, with fertility rate 4 life expectancy was 33, but life expectancy at 20 was 55 (Caldwell and Caldwell, 2003, p. 210).

Table 4A. Some life statistics from WHO, year 2005¹⁷⁰

	Life expectancy at birth		Healthy life expectancy at birth		Adult mortality rate ¹⁷¹		Under 5 mortality rate ¹⁷²	Infant mortality rate ¹⁷³	Neonatal mortality rate ¹⁷⁴	Maternal mortality rate ¹⁷⁵
	male	female	male	female	male	female				
Italy	78	84	71	75	89	46	4	4	3	5
USA	75	80	67	71	137	81	8	7	4	14
Japan	79	86	72	78	92	45	4	3	1	10
Russia	59	72	53	64	470	173	14	11	7	65
India	62	64	53	54	280	207	74	56	39	540
Brazil	68	75	57	62	225	118	33	28	13	260
China	71	74	63	65	155	98	27	23	18	56
South-East Asian Region	62	65	54	55	272	207	68	51	35	460
African Region	48	50	40	42	480	438	165	99	40	910
World	64	68	56	59	233	164	74	51	28	400
European Union¹⁷⁶	76	82						5		

Some interesting extreme values (giving the existing range), from CIA *Factbook* (2007): Birth rate (births/1000) 50 (Niger)--7,34 (Hong-Kong); death rate (deaths/1000): 30.35 (Swaziland¹⁷⁷)--2.16 (United Arab Emirates); Infant Mortality Rate: 184.84 (Angola)--2.3 (Singapore); Life Expectancy at Birth: 83.52 (Andorra)--32.23 (Swaziland); Total Fertility Rate (children born/woman): 7.38 (Mali)---0.98 (Hong-Kong) (1.50 EU).

¹⁷⁰ WHO, 2007. For a definition of the different indicators and the methods used in their assessment, see WHO, *National Burden of Disease Studies: A Practical Guide*. Geneva; WHO, 2001.

¹⁷¹ Probability of dying aged 15–60 years per 1000 population.

¹⁷² Probability of dying aged < 5 years per 1000 live births.

¹⁷³ Per 1 000 live births. Mortality in the first year of life.

¹⁷⁴ Per 1 000 live births. Mortality in the first 28 days of life.

¹⁷⁵ Per 100,000 live births.

¹⁷⁶ From CIA (2007).

¹⁷⁷ In the case of Swaziland the very high mortality rate and the the very low life expectancy can be related to a HIV/AIDS adult prevalence rate of nearly 40% (cf. CIA *Factbook* , 2007)..

Table 5A. Some life statistics of Eastern Europe from WHO, year 2005¹⁷⁸

	Life expectancy at birth		Healthy life expectancy at birth		Adult mortality rate ¹⁷⁹		Under 5 mortality rate ¹⁸⁰	Infant mortality rate ¹⁸¹	Neonatal mortality rate ¹⁸²	Maternal mortality rate ¹⁸³
