MPRA Paper No. 23651, posted 6. July 2010 17:06 UTC
ABSTRACT

Recent years have witnessed a change in focus from considerations of factors which could impede competition, for example over-regulation, to the need to strike a balance between over-regulation and insufficient regulation – in order to provide the right level of safety for consumers (such that they are protected from risky investments). A driving force behind the need for deregulation over the past two decades has been the objective and desire to foster competition. Re-regulation thereafter assumed centre stage in some jurisdictions in response to the need to manage cross sector services' risks more efficiently. Rescue cases involving guarantees (contrasted with restructuring cases) during the recent Financial Crisis, have illustrated the prominent position which the goal of promoting financial stability has assumed over that of the prevention or limitation of possible distortions of competition which may arise when granting State aid.

The importance attached to maintaining and promoting financial stability - as well as the need to facilitate rescue and restructuring measures aimed at preventing systemically relevant financial institutions from failure, demonstrate how far authorities are willing to overlook certain competition policies. However increased government and central bank intervention also simultaneously trigger the usual concerns – which include moral hazard and the danger of serving as long term substitutes for market discipline.

An interesting observation derives from the relationship between State aid grants, competition, and the potential to induce higher risk taking levels. Whilst the need to promote and maintain financial stability is paramount, safeguards need to be implemented and enforced to ensure that measures geared towards the aim of sustaining system stability (measures such as lender of last resort arrangements and State rescues) do not unduly distort competition as well as induce higher risk taking levels. This paper will draw attention to safeguards which have been provided by the Commission where approval is considered for the grant of State aid to financial institutions whose problems are attributable to inefficiencies, poor asset liability management or risky strategies.

Whether the distinction drawn by the Commission – with regards to the preferential grant of recapitalisation packages to fundamentally sound banks (which require less restructuring measures) is justified, will also be considered.

How far central banks and governments should intervene and how far distortions of competition should be permitted ultimately depends on how systemically relevant a financial institution is.

Key Words: Competition, central banks, recapitalisation, stability, regulation, financial crises, fundamentally sound financial institutions
The Role of Central Banks and Competition Policies in the Rescue and Recapitalisation of Financial Institutions During (and in the Aftermath of) the Financial Crisis

Marianne Ojo

A. Introduction

It is argued that competition assessments – whether carried out only by the competition authority or in conjunction with the financial sector regulator, are vital for state aid applications and many emergency measures which may have been established by governments. Whether new regulatory procedures which are to be introduced will facilitate “meaningful competition assessments” to be made within the available time period during times of crises, constitutes a topic of controversial dimensions and such controversy is also acknowledged.

Up till the 1980s, it was widely acknowledged that competition contributed to the deterioration of financial stability – intense competition was particularly considered to favour excessive levels of risk taking – hence contributing to higher risks of individual bank failures. However it has been recently observed that “panic runs can occur independently of the degree of competition in the market.”

Other views regarding contributory factors to financial crises and particularly financial instability, embrace criticisms of the monetary policies established by central banks. The standard argument advanced by critics of monetary policies during past financial crises, relates to the fact that “interest rates were kept too low for too long and that this created for investors, both an incentive and a possibility to take excessive risks.” A further criticism of monetary policy is attributed to the fact that investors are encouraged to believe that monetary policies will always bail them out in times of financial difficulties.

Whilst the need to promote and maintain financial stability is paramount, safeguards need to be implemented and enforced to ensure that measures geared towards the aim of sustaining system stability (measures such as lender of last resort arrangements and State rescues) do not unduly distort competition as well as induce higher risk taking levels. This paper will draw attention to safeguards which have been provided by the Commission where approval is considered for the grant of State aid to financial institutions whose problems are attributable to inefficiencies, poor asset liability management or risky strategies. Under its predecessor paper, safeguards which are in

6 Since „central banks would not lean against bubbles but have been prepared to clean up the consequences after they burst.” See ibid
7 Please particularly refer to section four of the paper (by the author) “Liquidity Assistance and the Provision of State Aid to Financial Institutions” (2010) Munich RePEc and SSRN Working Papers
place to ensure that competition is not distorted were considered under section four of the paper. Such safeguards, as considered in the paper, are applicable both to financial institutions whose viability problems are exogenously induced (and also related to extreme conditions which prevail in the financial market), as well as those financial institutions whose endogenous problems are related to inefficiency or excessive risk-taking. The paper also considered the rationale for the distinction between these institutions and concluded that financial institutions whose problems are attributable to inefficiencies, poor asset liability management or risky strategies should be accorded the same treatment as those whose viability problems are exogenously induced (and also related to extreme conditions which prevail in the financial market) as far as such „non fundamentally sound“ institutions are considered to be systemically relevant.

Whether the distinction drawn by the Commission – with regards to the preferential grant of recapitalisation packages to fundamentally sound banks (which require less restructuring measures) is justified will be considered.

This paper is structured as follows: Under the second section, prominence is given to highlighting the distinction between fundamentally sound financial institutions and those not considered to be fundamentally sound. In this respect, the preferential grant of recapitalisation schemes to fundamentally sound financial institutions will be emphasised. The third section will then consider measures which have been established as means of minimising and avoiding distortions of competition. The third section will also consider the extent to which the objective of promoting financial stability should override that of the need to minimise distortions of competition. This section is structured into four parts:

I. Safeguards Against Possible Distortions of Competition in Recapitalisation Schemes
II. Prevention and Limitation of Undue Distortions of Competition.
III. Exit Strategies to Address Distortions to Competition Instituted by Crisis Responses
IV. Recapitalisation Schemes in Respect of Non Fundamentally Sound Institutions and the Grant of State Capital: The Objective of Fostering Competition Overriding the Need to Promote Financial Stability?

The fourth section will then consider the reasons behind the increasing prominence of the role assumed by central banks in regulation – in their capacities as regulator, monetary policy setters and lender of last resort providers. Such a consideration will be facilitated through an overview of the impact of the recent Financial Crisis.

Should lender of last resort arrangements be granted to a wider extent under complementary arrangements which support recapitalisation schemes than those which support guarantee schemes or vice versa? What are the benefits of expanding the role of central banks as opposed to the disadvantages of increased central bank intervention in rescues? These are amongst several points to be deliberated on in this section before a conclusion is drawn in the fifth and final section of the paper.
B. Recapitalisation Schemes

Guarantee schemes could be distinguished from recapitalisation schemes in that recapitalisation schemes are generally used in collaboration with financial institutions that are “fundamentally sound but which may experience distress because of extreme conditions in financial markets.” However, the Recapitalisation Communication also makes provision for banks which are not so fundamentally sound.\(^9\)

The objective being the provision of public funds in order “to consolidate the capital base of the financial institutions directly or to facilitate the injection of private capital by other means, so as to prevent negative systemic spill overs.”\(^10\)

Under section 2 paragraph 14 of the Banking Communication, distortions of competition resulting from schemes supporting the viability of institutions which are illiquid but otherwise fundamentally sound, will normally be more limited and require less substantial restructuring than those financial institutions which are particularly affected by losses stemming for instance from inefficiencies, poor asset-liability management or risky strategies. In the paper preceding this,\(^12\) the justification for the grant of State aid to institutions whose losses result from inefficiencies, poor asset-liability management or risky strategies was considered. Furthermore, the grant of State aid to such institutions was justified on the basis that systemic relevant institutions within this category,\(^13\) whose failure pose such disastrous consequences for financial stability, should not be allowed to fail.

With respect to purposes which the recapitalisation of banks could serve, three common objectives are listed in the Commission’s Communication\(^14\) and these are as follows:

- Contribution to the restoration of financial stability as well as the restoration of the confidence needed for the recovery of inter-bank lending. Further, additional capital serves as a cushion during periods of recession by absorbing losses and reducing the likelihood and risk of banks becoming insolvent.\(^15\)

---

\(^9\) Recapitalisation schemes constitute a “second systemic measure in response to the recent financial crisis to be used to support financial institutions that are fundamentally sound but which may experience distress because of extreme conditions in financial markets.” See Banking Communication Section 4 paragraph 34 of the “Communication from the Commission — The application of State aid rules to measures taken in relation to financial institutions in the context of the current global financial crisis” (2008/C 270/02) at page 5

\(^10\) See Section 2.3 paragraph 43 of the Communication from the Commission — The recapitalisation of financial institutions in the current financial crisis: limitation of aid to the minimum necessary and safeguards against undue distortions of competition - which states that the recapitalisation of banks which are not fundamentally sound should be subject to stricter requirements. Furthermore, paragraph 44 states that “As far as remuneration is concerned, it should in principle reflect the risk profile of the beneficiary and be higher than for fundamentally sound banks. This is without prejudice to the possibility for supervisory authorities to take urgent action where necessary in cases of restructuring.”

\(^11\) See section 4 paragraph 34 of the Banking Communication

\(^15\) ibid
- Facilitating lending to the real economy

- State recapitalisation could also serve to address and rectify insolvency problems faced by financial institutions – such problems having arisen as a result of such institutions’ particular business model or investment strategy.

In respect of this third objective (for which the recapitalisation of banks could serve), it is interesting to note that Paragraph 6 of the Recapitalisation Communication, provides for “problems of financial institutions facing insolvency as a result of their particular business model or investment strategy” - given the fact that paragraphs 4 and 5 explicitly provide for fundamentally sound financial institutions. Whilst paragraph 4 _interalia_ states that „additional capital provides a cushion in recessionary times to absorb losses and limits the risk of banks becoming insolvent“, paragraph 5 recognises that fundamentally sound banks may prefer to restrict lending in order to avoid risk and maintain higher capital ratios.

According to paragraph 6 of the Recapitalisation Communication, „a capital injection from public sources providing emergency support to an individual bank may also help to avoid short term systemic effects of its possible insolvency. In the longer term, recapitalisation could support efforts to prepare the return of the bank in question to long term viability or its orderly winding-up.“ Against the backdrop of this exceptional provision, a case relating to the grant of capital injections for a non fundamentally sound financial institution will be considered.

Hypo Real Estate (HRE) – Capital Injections

„In April 2010, the German Financial Markets Stabilisation Fund (SoFFin) approved the next recapitalisation tranches of up to €1.85 billion for Hypo Real Estate Holding AG (HRE), within the framework of the existing capital plan. It is planned that this capital be paid into HRE’s capital reserve in at least two tranches as necessary. In particular, the recapitalisation is necessary in order for DEPFA BANK plc to maintain its minimum regulatory capital ratios in the near future. The capital measure is subject to approval by the European Commission. Including the support measure at hand, SoFFin has to date, provided total recapitalisation support of around € 7.85 billion to the HRE Group.“

Having regards to i) Article 87(3)(b) EC Treaty which enables the Commission to declare aid compatible with the Common Market if it is "to remedy a serious disturbance in the economy of a Member State"; the fact that ii) Germany considered HRE to be a bank with systemic relevance for the financial market, iii) BaFin confirmed that the own capital of the bank would fall short of the
regulatory requirements if the bank did not receive further capital and iv) that bank supervisory procedures would be initiated if the bank did not receive further capital, the Commission assessed the State aid measures for HRE under Article 87(3)(b) of the EC Treaty.\textsuperscript{19}

„The Commission decided to assess the temporary compatibility of capital measures until a decision on the restructuring plan was taken - since Germany had asked for temporary approval of the capital measures. If the measures were held to be compatible the Commission decided it would not consider whether the measures were already compatible under the German rescue aid scheme.“\textsuperscript{20}

Even though HRE was in the process of restructuring at the time, and Germany had already provided a restructuring plan which was subsequently updated and was being assessed by the Commission at the time, the need to temporarily grant emergency aid prior to the final assessment of the revised restructuring plan was acknowledged since financial stability was at stake in the prevailing case and urgent remedial action was required to keep the ailing bank afloat – this also being confirmed by the national financial supervisory authority.\textsuperscript{21}

In its decision, the Commission decided to temporarily find compatible with the Common Market the capital injection amounting to EUR 60 million carried out in March 2009\textsuperscript{22}, the capital injection amounting to EUR 2,959,632,240 carried out in June 2009, and the capital injection amounting to EUR 3.0 billion to be carried out in November 2009 in favour of HRE until the Commission has taken a final decision on the restructuring plan.\textsuperscript{23} Furthermore the Commission concluded that the capital injections „are appropriate, necessary and proportional, and can be considered compatible with the Common Market on a temporary basis until a final decision was taken on the restructuring plan of HRE.“\textsuperscript{24}

Such a decision to accord priority to financial stability will be contrasted to other scenarios which give more preference to the need to minimise and avoid distortions of competition in the next section.

\textsuperscript{19}See European Commission, „State Aids n° C 15/2009 (ex N 196/2009), N 333/2009 & N 557/2009 – Germany Hypo Real Estate – Extension of Formal Investigation Procedure, and Temporary Find Capital Injections Compatible“ paragraphs 41 and 42; at pages 6 and 7; „The Commission reiterated doubts on the viability of HRE in its decision (Decision C(2009) 5888 final) of 24 July 2009 and the present case, taking into account the more detailed figures in the updated restructuring plan and questioning whether the intended restructuring was sufficient to allow restoration of long-term viability on the basis of the State aid received and planned.

The Commission also identified three problematic aspects that could affect the long-term sustainability of HRE’s business model – which it intended to investigate further. The three problematic aspects included:i) Funding, ii)Short- and long-term profitability and (iii)the fact that HREindicated in its revised business plan that it wanted to remain active in two fields: Commercial Real Estate and Public Finance. Nevertheless, the Commission observed at the time that the intended margin in the area of public finance was very low and that market pressure could further reduce achievable margins.“ See paragraphs 58 -61; ibid

\textsuperscript{20}See ibid at paragraph 44

\textsuperscript{21}Ibid at paragraph 48

\textsuperscript{22}„With regard to its silent participation of EUR 1 billion, SoFFin was to receive a profit-related coupon of 10 %. This level of remuneration was considered to be in line with paragraph 44 of the Recapitalisation Communication, which stipulates that where the price cannot be set to levels that correspond to the risk profile of the bank, it would nevertheless need to be close to that required for a similar bank under normal market conditions. Moreover, the Commission highlighted the fact that HRE would not get capital at an economically justifiable remuneration level on the market in the current circumstances but that given the fact that HRE was in difficulty, it should pay at least a reasonable price - that 10 % was considered to be an acceptable level.“ (See Commission decision of 12 May 2009 in case N 615/2008, BayernLB); see paragraph 52; ibid

\textsuperscript{23}See ibid; section 5 at page 11; „The capital injection of EUR 60 million had only limited scope, resulting in a 8.65% share of HRE’s equity capital which did not give Germany a major influence on the bank“; see paragraph 49

\textsuperscript{24}Ibid at paragraph 54
C. Minimising and Avoiding Distortions of Competition

I. Safeguards Against Possible Distortions of Competition in Recapitalisation Schemes

As well as highlighting the Banking Communication's emphasis on the need for safeguards aimed at preventing and limiting possible distortions of competition in recapitalisation schemes, paragraph 35 of the Recapitalisation Communication also makes mention of the Banking Communication's requirement that capital injections be limited to the minimum necessary and not to allow the beneficiary to engage in aggressive commercial strategies which would be incompatible with the underlying objectives of recapitalisation. Where higher remuneration is required by the State, there will (as a general principle) be less need for safeguards - since the level of price, in the Commission’s view, will limit distortions of competition.

However this can be contrasted with the case involving Hypo Real Estate where in respect of the capital injections carried out by acquiring share capital and the injection into the reserves, the German authorities highlighted that SoFFin as 100% HRE owner, was entitled to a shareholder's usual remuneration. Furthermore, it was stated that „for a distressed bank, no market-conform remuneration can be expected, at least in the short-term, for such provision of capital and that in line with the Recapitalisation Communication, such a situation required a thorough and far-reaching restructuring."

Safeguards which have been proposed as means of preventing distortions of competition with guarantee schemes include restrictions on commercial conducts through for example market share ceilings, limitations to the size of the balance-sheet of the beneficiary institutions or other behavioural constraints that may be needed to achieve the purpose of the guarantee. Issues which are also considered to arise with these safeguards include:

1) How they can be properly monitored and enforced since financial services are typically not regarded as standardized products.

2) The likelihood that some restrictions such as those on the growth of undertaking may themselves generate anticompetitive effects in terms of collusive agreements.

[Note:Footnotes are not included in the plain text representation as per the instruction.]
3) Of paramount importance is the concern related to the remuneration of the guarantee scheme or any other form of intervention such as the recapitalization schemes.32

II. Prevention and Limitation of Undue Distortions of Competition

Three levels of possible distortions of competition are highlighted in the Commission Communication33 on the Recapitalisation of Financial Institutions and these are as follows:34

− First, recapitalisation by one Member State of its own banks should not give those banks an undue competitive advantage over banks in other Member States. Access to capital at considerably lower rates than competitors from other Member States, in the absence of an appropriate risk-based justification, may have a substantial impact on the competitive position of a bank in the wider single European market.35

− Secondly, recapitalisation schemes which are open to all banks within a Member State without an appropriate degree of differentiation between beneficiary banks according to their risk profiles may give an undue advantage to distressed or less-performing banks compared to banks which are fundamentally sound and better-performing.36

− Thirdly, public recapitalisation, in particular its remuneration, should not have the effect of putting banks that do not have recourse to public funding, but seek additional capital on the market, in a significantly less competitive position.37

In considering whether State aid (and in particular emergency guarantees) was to be granted to Hypo Real Estate, the Commission in attempting to ensure that distortions of competition were minimised (as far as possible), considered the Requirement that aid granted “does not exceed what is strictly necessary to achieve its legitimate purpose and that distortions of competition are avoided or minimized as far as possible” - in line with the general principles which constitute the basis of State aid rules of the Treaty, which require that the aid granted “does not exceed what is strictly necessary to achieve its legitimate purpose and that distortions of competition are avoided or minimized as far as possible.”38

32 “In principle, the remuneration of any type of support such as the issuance of new shares or asset swaps should be determined on the basis of a market-oriented valuation and be as close as possible to the market rate. However, at the current moment, the pricing mechanism in the markets seems to have stopped working properly. In such a situation, an important question is how to explicitly calculate an appropriate remuneration for the public supports in a time when markets are so highly illiquid and volatile that market prices may no longer be tied to the value of fundamentals. This issue resembles the current debate in the application of mark-to-market accounting standards when markets do not work properly.” ibid

33 See paragraphs 7-10 of the Communication from the Commission – „The recapitalisation of Financial Institutions in the Current Financial Crisis: Limitation of aid to the Minimum Necessary and Safeguards Against Undue Distortions of Competition

34 See paragraphs 8 -10; ibid

35 „Excessive aid in one Member State could also prompt a subsidy race among Member States and create difficulties for the economies of Member States which have not introduced recapitalisation schemes. A coherent and coordinated approach to the remuneration of public capital injections, and to the other conditions attached to recapitalisation, is indispensable to the preservation of a level playing field. Unilateral and uncoordinated action in this area may also undermine efforts to restore financial stability (‘Ensuring fair competition between Member States’).”

36 „This will distort competition on the market, distort incentives, increase moral hazard and weaken the overall competitiveness of European banks (‘Ensuring fair competition between banks’).”

37 „A public scheme which crowds out market-based operations will frustrate the return to normal market functioning (‘Ensuring a return to normal market functioning’).”

III. Exit Strategies to Address Distortions to Competition Instituted by Crisis Responses

According to the Recapitalisation Communication, ‘‘recapitalisation measures need to contain appropriate incentives for State capital to be redeemed when the market so allows. The simplest way to provide an incentive for banks to look for alternative capital is for Member States to require an adequately high remuneration for the State recapitalisation.” 39

Furthermore, the Communication states that ‘‘if a Member State prefers not to increase the nominal rate of remuneration, it may consider increasing the global remuneration through call options or other redemption clauses, or mechanisms that encourage private capital raising, for instance by linking the payment of dividends to an obligatory remuneration of the State which increases over time.” 40

In facilitating exit strategies, ‘‘member States may also consider using a restrictive dividend policy to ensure the temporary character of State intervention.” 41

The OECD’s proposal is founded on the distinction between the types of aid provided for i) financial firms for systemic reasons and ii) for non-financial firms with structural problems. As pre requisite for the grant of aid to non financial firms, the requirement that ‘‘structural reforms to a sustainable industry structure” exist, was put forward. 42

Furthermore, “the need to ensure that structural reforms promote the long-term viability of these firms” is considered to constitute part of an exit strategy. 43 Other forms of aid considered include: 44
• nationalization of financial institutions or non-financial firms;
• state-sponsored capital injections;
• extended liquidity facilities;
• interbank lending guarantees; and
• state acquisition of so-called “toxic assets”.

Recapitalisation Schemes in Respect of Non Fundamentally Sound Institutions and the Grant of State Capital: The Objective of Fostering Competition Overriding the Need to Promote Financial Stability?

Why should financial institutions whose problems are attributable to inefficiencies, poor asset liability management or risky strategies not be accorded the same treatment as those whose viability problems are exogenously induced (and also related to extreme conditions which prevail in the financial market) as far as such “non fundamentally sound” institutions are considered to be systemically relevant?

Section 2.3 paragraphs 43 and 44 of the Recapitalisation Communication highlights safeguards which are available where the grant of State capital to non fundamentally sound institutions are approved. Banks which would require more far reaching restructuring and which are considered not to be fundamentally sound are subject to more stringent requirements than fundamentally sound financial institutions (which would require less restructuring). Such stringent requirements include:

- The requirement that remuneration should “in principle reflect the risk profile of the beneficiary and be higher (for non fundamentally sound banks) than for fundamentally sound banks - without prejudice to the possibility for supervisory authorities to take urgent action where necessary in cases of restructuring.”

- The acceptability and approval of use of State capital for non fundamentally sound banks being dependent on the condition of either a bank's winding-up or a thorough and far-reaching restructuring, including a change in management and corporate governance where appropriate.

The Commission in its Communication explicitly states that „Notwithstanding the need to ensure financial stability, the use of State capital for these banks (non fundamentally sound financial institutions) can only be accepted on the condition of either a bank's winding-up or a thorough and far-reaching restructuring, including a change in management and corporate governance where appropriate.”

Does this infer that the Commission is prepared to override the paramount objective of financial stability – by according greater prominence to the goal of fostering competition? This might initially appear to be the case. As highlighted in the second section of its predecessor paper, financial institutions whose problems are attributed to “inefficiencies, poor asset-liability management or risky strategies” and which are considered to be systemically relevant, should benefit from state aid where restructuring of such institutions occur – to the extent that senior management (or indeed the entire management) of those institutions are replaced.

---

46 See paragraph 44 which furthermore adds that “Where the price cannot be set to levels that correspond to the risk profile of the bank, it would nevertheless need to be close to that required for a similar bank under normal market conditions. “

47 As a result, either a comprehensive restructuring plan or a liquidation plan will have to be presented for these banks within six months of recapitalisation. As indicated in the Banking Communication, such a plan will be assessed according to the principles of the rescue and and restructuring guidelines for firms in difficulties, and will have to include compensatory measures.”

48 See paragraph 44 of the Recapitalisation Communication. (Communication from the Commission — The recapitalisation of financial institutions in the current financial crisis: limitation of aid to the minimum necessary and safeguards against undue distortions of competition )

Such intentional safeguard by the Commission whilst ensuring that competition is not unduly distorted, also serves as a warning to “too big to fail firms” that guaranteed government or central bank intervention in the case of impending financial difficulties does not serve as an excuse for complacency or reckless risk taking behaviour. Such a move by the Commission is therefore aimed at deterring moral hazard whilst fostering competition.

D. The Increased Prominence of the Role Assumed by Central Banks – The Impact of the Recent Financial Crisis.

According to recent observations, some aspects of the more prominent role which central banks have assumed since the recent crisis (such a role being partly attributed to circumstances triggered by the recent financial crises), are likely to become more permanent during the aftermath of the Crisis.50

Unconventional measures which were introduced by advanced economies in response to the latter stages of 2008 include liquidity provision to banks on extra ordinary terms – particularly for longer periods of maturity, intervention in selected credit markets – a measure aimed at supporting secondary market liquidity and the outright purchase of bonds – such purchase being aimed at improving financing conditions beyond that which can be achieved by policy rate cuts.51

A change in supervisory responsibilities and functions of regulators – with more powers being transferred to central banks, is also being witnessed in jurisdictions such as the UK. This response has been prompted by the realisation that the allocation of responsibilities between the tripartite arrangement (consisting of the single financial services regulator – the Financial Services Authority (FSA), the Treasury and the Bank of England) did not function efficiently and timely52 to avert the crisis generated during the events leading to the collapse of Northern Rock. Greater powers have been transferred to the Bank of England who used to be responsible for bank supervision before this role was transferred to the FSA in 1997.

“The Bank of England’s focus on meeting the inflation target” it is contended, “distracted it from monitoring other important variables that affect financial stability.”53 In response to some of the issues brought to light as a result of the recent crisis, the Bank is now to be given responsibility for

51 ibid at page 3
52 It is also highlighted that a key reason for the failure of the tripartite system of financial oversight during Northern Rock’s collapse was a failure by the tripartite body to properly identify and monitor risks to the financial system as whole. See Shearman and Sterling LLP, „UK Government Proposals for Financial Regulatory Reform“ Financial Institutions Advisory and Financial Regulatory Group Publications 7 June 2010
53 ibid; “Under EU legislation currently being discussed in Brussels, there may in the foreseeable future, be a new financial regulatory framework that aims to strengthen prudential supervision across the EU. Macro-prudential supervision would be the responsibility of a new European Systemic Risk Board that would, with the assistance of the European Central Bank, be tasked with giving early warning of any growing systemic risks and, where necessary, recommending action to deal with such risks. Micro-prudential supervision would be carried out by the European System of Financial Supervisors, made up of national supervisors, and by three European Supervisory Authorities for the banking, securities and insurance and occupational pensions sectors. In order for the new EU supervisory framework to work properly, the responsibilities of the Bank of England and the FSA would need to correspond with those of the new EU institutions and their counterparts in other member states.”
systemic oversight. As a result, the grant of further supplementary oversight functions to the Bank of England in relation to the associated subject of prudential regulation, it is further argued, will be desirable. Even though a change in supervisory roles – with respect to present regulator and the central bank is also considered to be a possibility in Germany, a radical change such as that which is currently taking place in the UK, is not foreseen. This in partly attributable to the fact that the Deutsche Bundesbank, the central bank, was responsible for numerous vital supervisory functions and was more engaged in bank supervision – in contrast to the position which existed with the Bank of England.

Whilst the need for a greater role for central banks in facilitating financial stability and promoting systemic oversight is a positive and justified development, the growing intervention of central banks in financial markets gives rise to concerns. The recent Financial Crisis witnessed a series of rescues and restructuring of financial institutions – such being facilitated by State aids – hence government intervention. Central bank intervention provides an invaluable source of liquidity funding in terms timeliness (particularly in view of urgent scenarios) when compared to State aids. The promptness of central banks in addressing serious liquidity problems faced by financial institutions has contributed to the realisation that its role in promoting financial stability should be accorded greater prominence. At the same time, it appears to be widely acknowledged that “the role of the lender of last resort facility should not be used to address individual bank insolvencies.”

The “classic” view – under which it is held that “central banks should lend freely at a penalty rate as well as against good collateral” is considered to serve as a means of ensuring that:

- 1) The lender of last resort is only used for illiquid banks
- 2) In emergency situations

---

54 Ibid; Furthermore, “central banks are increasingly being put in charge of overseeing systemic risk. This is because, as “the ultimate provider of liquidity”, they are in a unique position to focus on system-wide risks and obtain an integrated view of both the individual financial institutions and the financial system as a whole. Even when financial institutions look strong on an individual basis, systemic risk can emerge as a result of the interconnectedness of financial institutions, markets and infrastructures. The macroprudential approach to supervision has to take account of these externalities.

Two recent examples of this approach are the creation of the European Systemic Risk Board (ESRB) at the ECB, and the proposed Financial Stability Oversight Council in the United States. The ESRB will be an independent body responsible for conducting macroprudential oversight of the European Union’s financial system as a whole. It is thus expected to fill a gap in the ability of financial regulators to detect, assess and contain the build-up of systemic risks. Similarly, the Financial Stability Oversight Council of regulators in the United States is expected to identify systemically significant companies and monitor markets for the development of asset price and credit booms that might threaten financial stability. According to these proposals, the Fed would be responsible for the supervision of systemically important financial institutions.” see H Hannoun “The Expanding Role of Central banks Since the crisis: What are the Limits?” June 2010 Bank for International Settlements Publications http://www.bis.org/speeches/sp100622.pdf?noframes=1 at page 6

57 See Organisation for Economic Cooperation and Development, “Competition and the Financial Crisis” at page 6 of 28

58 Another reason why central banks need to unwind their intervention in financial markets is that they are not immune to credit risk. The conventional rule is that central bank lending must be fully collateralised. Unsecured lending is a risky art, requiring discretion, which is incompatible with the principles of transparency and equal treatment in access to central bank credit. Nor is it consistent with the accountability of the central bank.” See H Hannoun “The Expanding Role of Central banks Since the crisis: What are the Limits?” June 2010 Bank for International Settlements Publications http://www.bis.org/speeches/sp100622.pdf?noframes=1 at page 9

59 See Organisation for Economic Cooperation and Development, “Competition and the Financial Crisis” at page 6 of 28
A restricted application of the lender of last resort facility (as much as possible) is not only justified on the basis that moral hazard could occur – since banks or financial institutions experiencing financial difficulty will almost always expect to be bailed out when such a need arises (and hence will be induced to take greater levels of risks than the case would have been if no such facility had existed). It is also argued that “the sustained bloating of their balance sheets means that central banks still dominate some financial market segments thereby distorting the pricing of some important bonds and loans, discouraging necessary market-making by private individuals and institutions.”

Should lender of last resort arrangements be granted to a wider extent under complementary arrangements which support recapitalisation schemes than those which support guarantee schemes or vice versa?

Lender of last resort arrangements should be granted to illiquid systemically relevant financial institutions in emergency situations. This is partly attributed to the fact that Paragraph 6 of the Recapitalisation Communication, interestingly, provides for “problems of financial institutions facing insolvency as a result of their particular business model or investment strategy.”

Other reasons why the lender of last resort facility should be used for emergency situations and systemically relevant institutions in particular, are attributed to the role played by central banks during the recent crisis – during which the role of central banks “in stepping in to replace disrupted and dislocated funding markets” was highlighted. In drawing attention to such developments, the need to avoid dependency on the central bank – to the extent that it does not become the “lender of first resort” (whenever the markets reveal signs of impending financial failures), is also emphasised.

Given the scale of government intervention and State rescues which occurred during the recent crisis – as well as the prominence accorded to measures aimed at preventing and limiting distortions of competition, calls have been made for competition authorities to take on more formidable roles in designing and implementing exit strategies. In order to foster competition as much as possible, it is proposed that “governments should provide financial institutions with incentives to prevent them from depending on government support once the economy begins to recover.” Such incentives, it is further argued, could assume the form of rescue measures having conditions built into them – conditions which would induce financial institutions to opt for private sources of investments (rather than public sources of investment) when economic conditions return to normal.

According to key findings published by the OECD, the design of competition policies in banking within several jurisdictions in Europe has undergone substantial reform at national level – with very

---

61 “During the crisis, central banks had to step in to replace disrupted and dislocated funding markets. Severe tensions in interbank, foreign exchange swap and some segments of securities markets – including, lately, government bond markets – hampered the monetary policy transmission mechanism. The usual relationship between key policy rates and the rates applicable in the real economy was disrupted, and the main tool for influencing financing conditions in the real economy did not work properly.” ibid

63 Organisation for Economic Co operation and Development, „, Competition and the Financial Markets” at page 10
64 An example is provided where governments could make it un lucrative for beneficiaries to rely on public capital injections any longer than they have to – by imposing restrictions on them (restrictions such as escalating dividends or interest rates). At some point, it is further argued, private sources of equity will become more desirable; see ibid
unprecedented changes occurring over the last two decades.\textsuperscript{65}

The recent crisis has also witnessed unprecedented levels of intervention – in terms of government intervention. The OECD’S findings also highlight the fact that competition authorities around the world have also been compelled to participate in these actions for reasons other than those related to intense time pressure for action, - whilst questions relating to the application of competition policy to the financial sector have arisen.\textsuperscript{66}

Whilst the findings highlight the controversy generated by some who argue that competition rules should be suspended for the duration of the crisis - thus allowing regulators to focus only on the objective of safeguarding the stability of the financial system, it concludes that whether competition is desirable at all when there is a systemic crisis, is a matter which generally, is in need of clarification.\textsuperscript{67}

\textbf{E. Conclusion}

In addition to other points which have been considered and addressed in this paper, it could be argued that the Banking Communication gives greater prominence to the goal of promoting financial stability than competition concerns through: i) its requirement of general support measures which have to be „well-targeted in order to be able to achieve effectively the objective of remediying a serious disturbance in the economy“\textsuperscript{68}, ii) its objective of providing guidance on the criteria relevant for the compatibility with the Treaty of general schemes as well as individual cases of application of such schemes and ad hoc cases of systemic relevance”, as provided for within section 1 paragraph 5 of the Banking Communication. Whilst the Banking Communication also accords a respectable degree of its content towards highlighting the need to minimise factors which could give rise to competition concerns, the Recapitalisation Communications could be argued to accord greater prominence to safeguards aimed at minimising and preventing distortions of competition.

The rationale for central bank and government intervention through lender of last resort facilities and State rescues respectively, is justified where safeguards exist to ensure that such intervention does not induce increased levels of risk taking or result in undue distortions of competition. Through its provision in section 2.3 paragraph 44 of the Recapitalisation Communication, the European Commission has taken a huge step in its efforts to ensure that moral hazard is discouraged, undue distortions of competition minimised – whilst providing life lines to systemically relevant financial institutions whose problems are attributed to “inefficiencies, poor asset-liability management or risky strategies”. Such life line is provided „on the condition of either a bank's winding-up or a thorough and far-reaching restructuring, including a change in management and corporate governance where appropriate.“ In drawing a distinction between “the treatment of illiquid but otherwise fundamentally sound financial institutions” (where viability problems are exogenously induced and also related to extreme conditions which prevail in the financial market), and the treatment of financial institutions whose endogenous problems are related to inefficiency or excessive risk- taking, such a distinction is geared towards the objectives of:

\textsuperscript{65}For example, in Italy since December 2005 competition policy in banking is no longer enforced by the Bank of Italy but rather by the competition authority as in all other sectors. In the Netherlands, the Competition Act of 1998 applies to the banking sector, but only since 2000. See Organisation for Economic Cooperation and Development, “Competition and the Financial Crisis” at page 12

\textsuperscript{66}ibid at page 13

\textsuperscript{67}Others have instead emphasised the importance of applying strict competition rules in the current crisis as a means of ensuring a level playing field and a coordinated reaction to the crisis – as well as avoiding a futile race for subsidies between countries to attract depositors and investors. Moreover, the long-term effects of relaxing competition policy can be serious. Mergers that lead to very concentrated markets in particular are almost impossible to reverse.”; ibid

\textsuperscript{68}See paragraph 15 of the Banking Communication
1) Remedying a serious disturbance in the economy;
2) Ensuring that measure is proportionate \(^{69}\) to the challenge faced, not going beyond what is required to attain this effect; and
3) designed in such a way as to minimize negative spill over effects on competitors, other sectors and other member states.”

- in line with the general principles which constitute the basis of State aid rules of the Treaty (Article 87 EC Treaty and Article 107 TFEU (ex Article 87 EC Treaty).

---

\(^{69}\) According to paragraph 38 of the Commission's Communication on Recapitalisation “The extent of behavioural safeguards should be based on a proportionality assessment, taking into account all relevant factors and in particular, the risk profile of the beneficiary bank. While banks with a very low risk profile may require only very limited behavioural safeguards, the need for such safeguards increases with a higher risk profile. The proportionality assessment is further influenced by the relative size of the capital injection by the State and the attained level of capital endowment.”
