## ABSTRACT

The aim of this paper is to present a further contribution to the analysis of absolute convergence, associated with the neoclassical theory, of the manufactured industry productivity at regional level and for the periods from 1986 to 1994 and from 1995 to 1999. The main conclusions that should be noted is which the signs of convergence different between the several manufactured industries.

**Keywords:** convergence theories; panel data; manufactured industry; Portuguese regions

## 1. EMPIRICAL EVIDENCE OF ABSOLUTE CONVERGENCE, PANEL DATA

The purpose of this part of the work is to analyze the absolute convergence of output per worker (as a "proxy" of labor productivity), with the following equation ((1)Islam, 1995, based on the (2)Solow model, 1956):

$$\Delta \ln P_{it} = c + b \ln P_{i,t-1} + \nu_{it} \quad (1)$$

Table 1 presents the results for the absolute convergence of output per worker, in the estimations obtained for each of the manufactured industry of NUTS II, from 1986 to 1994 (3)(Martinho, 2011).

The convergence results obtained are statistically satisfactory for all manufacturing industries of NUTS II.

**Table 1:** Analysis of convergence in productivity for each of the manufacturing industries at the five NUTS II of Portugal, for the period 1986 to 1994

## 2. CONCLUSIONS

The signs of absolute convergence are different from one manufactured industries to another, but there is a curious results for the equipment transport industry, because present strong evidence of absolute convergence and we know that this industry is a dynamic sector. In another hand we have the textile industry that we expect find strong signs of absolute convergence, because we know this is a sector with weak dynamics, but we only see some evidence of convergence in the first period.
