**Rotary District 7620 Relative Membership Growth Potential Analysis
by County**

Quentin Wodon
Nonprofit Research Project

This brief applies a simple framework for assessing the relative potential for Rotary membership growth in different geographic areas. The analysis is relative in that areas are compared to each other through an econometric procedure. By design about half of the areas are considered as performing comparatively well in that they have membership rates above expectations. The other areas are considered as performing less well because they have membership rates below expectations, and thereby more potential for growth. The simulations entail assessing how much membership growth could be achieved by raising the performance of less well performing areas to their expected levels of performance. That is, relative membership potential gains are estimated by raising the performance of less well performing areas to the average performance in zone 33 as a whole, taking into account the fact that expected membership rates differ between areas. The analysis is conducted for Rotary zone 33 as a whole, which covers part of the Mid Atlantic and South Atlantic regions of the United States, but the results provided in this brief are for 13 geographic areas within district 7620, which covers part of Maryland and the District of Columbia. The results suggest that district 7620 has a comparatively low Rotary membership rate, but thereby also substantial potential for membership growth.

Introduction

Membership growth is a priority for many Rotary districts, especially in the United States. This is also the case for district 7620, which covers part of Maryland and the District of Columbia. In 2010, the year for which the analysis in this brief is conducted, the district had 67 clubs and 2480 Rotarians.

This brief does not discuss how membership growth could be achieved. But it does suggest a framework to identify geographic areas that could be targeted by the district leadership team for growth. Targeting specific areas for growth is likely to be beneficial. Indeed, Rotary districts cover large geographic areas and the resources available to leadership teams for recruiting and

retaining new members are limited. It therefore makes sense to focus efforts on areas where the potential for higher membership is likely to be largest.

The approach used in this district to identify areas with potential for membership growth is very simple. Membership rates in Rotary are estimated by comparing the number of Rotarians in an area to the number of high income households in that area. Next, expected membership rates are estimated on the basis of data for zone 33 as a whole. The difference between actual and expected membership rate together with the number of high income households in an area are then used to assess the potential for growth by area.

This brief presents a simple approach to measure how different areas are doing in terms of Rotary membership and where the potential for higher membership may be largest. The approach is applied to district 7620.

The brief is structured as follows. The next section describes the methodology used for measuring membership rates. In the following two sections, results are provided for district 7620 for current and potential membership rates. The last two sections discuss the magnitude of the potential membership gains that could be achieved in district 7620 and the potential contribution of the district to membership growth in zone 33. A conclusion follows.

Methodology

Rotary membership potential brief 2012/1 in this series discusses the methodology adopted for the analysis, and more details are available in Wodon (2012). This section summarizes very briefly the main features of the methodology.

An area's membership rate (denoted by MR) is defined as the number of Rotarians in the area divided by the area's number of high income households. For all areas in zone 33, the income threshold to qualify as a high income household is \$100,000, with the exception of districts 7610 and 7620 where the threshold has been set at \$150,000, in large part because of a higher cost of living in those areas.

The analysis is carried at the level of counties and other similar independent

administrative entities within each Rotary district, because carrying the analysis at lower levels such as that of zip codes would not yield reliable results (see Membership potential brief 2012/1 for the reasons that led to this choice).

Membership data for zone 33 suggest that there is a strong negative relationship between membership rates and the number of high income households in an area. Areas with many high income households tend to have much lower membership rates. Several hypotheses could be advanced for explaining this relationship. In areas with a many high income households, work pressures and time availability to participate in Rotary may be more constrained, the prestige associated with being a member of Rotary may be lower, and the opportunities to be involved in service work through other organizations may be more numerous. Whatever the underlying causes of this negative relationship, it should not be ignored because it is not reasonable to expect that areas with many high income households will be able to reach the same membership rates as areas with fewer high income households. For this reason, expected membership rates are estimated for all areas within zone 33. The simulations provided in this brief rely on the differences between actual and expected membership rates by area.

Current Membership Rates

Table 1 provides data on the number of geographic areas (typically counties), clubs, and Rotarians in each of the 15 districts in zone 33. The table also displays the number of high income households (HIH) by district as obtained

The Nonprofit Research Project

NPRP Brief 2013/7

from the American Community Survey and the resulting membership rates.

According to the Census Bureau, district 7620 had a total of 323,161 households with yearly income above US\$150,000 (estimates for 2005-2009). Note that the higher income threshold is used for District 7620. The district accounts for a substantial share of high income households in zone 33 (17.6%), but it accounts for only 6.8% of the Rotary membership in the zone (2480 Rotarians out of a total of 36,539).

District 7620 accounts for 17.6% of high income households, and 6.8% of Rotarians in zone 33. Its membership rate is 0.8%, versus an average of 2.8% in all districts in zone 33.

Table 1: Membership Rates by District in Zone 33, 2010

Source: Author

The district membership rate was 0.8% as of July 2010. All other districts in zone 33 have higher membership rates, with an average rate of 2.8% across the 15 districts. Because of the negative

relationship mentioned earlier between membership rates and the number of high income households in an area, the fact that district 7620 has a low membership rate does not necessarily imply poor performance in attracting Rotarians. Still, the potential for attracting new Rotarians in the district is likely to be significant.

Table 2 provides data on membership rates for the counties in the district as well as Baltimore City and the District of Columbia. Membership rates vary from 0.5% in Baltimore City to 3.6% in Frederick County, with an average rate of 1.1% across areas (this average is not the same as the district membership rate). Of the 13 areas, eight have membership rates below one percent. Even some of the areas with a relatively large number of clubs such as Baltimore County (10 clubs) and Montgomery County (13 clubs) have low membership rates. Anne Arundel County is the area with the largest number of Rotarians, at 383, and it has a membership rate of 1.1%. The area with the smallest membership is Calvert County, with 35 Rotarians and a membership rate of 0.6%.

Within district 7620, membership rates vary from 0.5% in Baltimore City to 3.6% in Frederick County. The average membership rate across geographic areas is 1.1%.

Potential Membership Rates

Regression analysis is used to estimate expected membership rates by area (see Rotary membership potential brief 2012/1, as well as Wodon (2012) for details). Next, simple simulations are conducted on the basis of the differences between current and expected membership rates by area.

Specifically, two simulations are implemented. In both simulations the areas that have a higher membership rate than the expected rate keep their membership rate (they continue to “over-perform”). The difference between the two simulations relates to the treatment of areas with membership rates below expected levels.

- (1) 100% gap reduction: This case assumes that all areas with lower membership rates than expected see their membership rate bumped up to the expected level.

- (2) 50% gap reduction: A more reasonable – but still ambitious – goal would be to reduce by half the gap between actual and expected membership for areas that have lower than expected membership rates. This is what is done in the second simulation.

Two simulations are carried for potential membership rates: (1) all areas with lower membership than expected see their membership rate reach the expected level; (2) only half of the gap between actual and expected membership is bridged for areas with lower than expected rates.

Table 3 reports the results of the two simulations for the counties and other entities in district 7620. Under the first scenario, the average membership rate across the areas would increase from 1.1% to 1.8% and the number of Rotarians in the district would reach 3,984. Under the second simulation the average membership rate across the counties increases from 1.1% to 1.4%, and the number of Rotarians in the district would reach 3,232. Even this second simulation may be optimistic given the decline in membership observed throughout the United States for some time. Therefore it could represent a medium term objective for the district.

In the first simulation, the number of Rotarians in the district increases to 3,984. In the second, it reaches 3,232. Other simulations can readily be performed with the data provided.

Another way to express the potential gains by county consists in computing realized membership rates by dividing the number of Rotarians in an area by the potential number of Rotarians under each of the two simulations. Districts with the lowest realized membership rates may well have the highest potential for growth. Realized membership rates can be computed under the two simulations. The realized membership rates are by definition lower when considering the 100% gap reduction than when considering the 50% reduction.

The realized membership rates for areas within district 7620 are provided in table 4. For example, as a proportion of what could be achieved with a 50% gap reduction, the realized membership rates for the areas which are below their expected levels of membership range from 38.7% in Calvert County to 75.7% for Harford County and Howard County. In Anne Arundel County, Frederick County, and St. Marys County the

realized membership rates are considered to be at 100% because those areas have a higher number of Rotarians than the expected level for their number of high income households.

Potential Membership Gains

In order to target areas for growth at the level of a district, one may combine the potential for increasing the membership rate and the size of the high income population. This is done in table 5 which provides the net gains in membership under the 50% simulation. Since estimates of the gains in membership are proportional to the gaps between actual and expected membership, it is straightforward to provide estimates for other targets.

Table 4: Realized Membership Rates by County in District 7620, 2010 (%)

Area (County)	100% gap reduction	50% gap reduction
Anne Arundel	100.0%	100.0%
Baltimore City	28.7%	44.6%
Baltimore	50.7%	67.3%
Calvert	24.0%	38.7%
Carroll	59.1%	74.3%
Charles	26.5%	41.9%
District of Col.	52.6%	69.0%
Frederick	100.0%	100.0%
Harford	60.8%	75.7%
Howard	60.9%	75.7%
Montgomery	59.3%	74.5%
Prince Georges	44.4%	61.5%
St. Marys	100.0%	100.0%
Mean	59.0%	71.0%

Source: Author

For example the gains under the 100% simulation would be twice those under the 50% simulation, and the gains under a 25% gap reduction would be half of those under the 50% gap reduction. Apart from providing expected gains in membership under the 50% gap

The Nonprofit Research Project

NPRP Brief 2013/7

reduction simulation, table 5 also ranks the counties in terms of the number of members gained (the ranks would be the same for any other proportional gap reduction simulation).

In district 7620, the five areas with the largest number of new members might be Montgomery County, Prince Georges County, Baltimore County, the District of Columbia, and the city of Baltimore.

In district 7620, the top five contributors of new members under the gap reduction simulations would be Montgomery County, Prince Georges County, the District of Columbia, Baltimore County, and finally the city of Baltimore. These areas are ranked higher in terms of potential membership gains because they typically combine a larger high income population with membership rates well below expected rates.

Table 5: Potential Membership Gains by County in District 7620, 2010

Area (County)	Gain with 50% gap reduction	Area rank (largest to smallest)
Montgomery	123	1
Prince Georges	106	2
District of Columbia	95	3
Baltimore	89	4
Baltimore City	77	5
Charles	65	6
Howard	64	7
Calvert	55	8
Harford	40	9
Caroll	37	10
Anne Arundel	0	-
Frederick	0	-
St. Marys	0	-
Sum	752	-

Source: Author

The three areas with a membership rate above the expected level do not contribute to membership gains under the simulations, but this does not mean of course that in reality there is no potential for growth there as well.

Contribution to Zone Growth

To what extent would gains in district 7620 contribute to overall gains for zone 33 under the simulations presented in this brief? The answer to this question is provided in table 6. In the table, membership has been increased in all districts using the same simulations for counties with memberships below expectations and the results aggregated at the level of the districts (note that the district level average membership rate is not equal to the mean membership rate across counties in a district since these are not linear functions but ratios). Membership in the zone could increase to 47,436 under the first simulation, and 43,205 under the second simulation.

From a base of 36,539, zone 33 membership could increase to 47,436 under the first simulation, and 43,205 under the second. District 7620 would account for 17.8% of zone growth.

The Nonprofit Research Project

NPRP Brief 2013/7

Table 6: Potential Membership Rates by District in Zone 33, 2010

District	50% gap Reduction		100% gap reduction	
	Mem.	Rate	Mem.	Rate
7530	1236	4.8%	1325	5.1%
7550	1425	4.6%	1570	5.1%
7570	4005	4.4%	4310	4.7%
7600	3846	1.7%	4729	2.1%
7610	2736	1.2%	3296	1.4%
7620	3232	1.0%	3984	1.2%
7630	1910	1.7%	2132	1.9%

7770	4465	3.2%	4632	3.3%
Mean	2700	3.0%	2965	3.2%
Sum	43205		47436	

Source: Author

Finally, table 7 provides the realized membership rates for each of the districts in the zone under the two simulations, as well as the gain in membership that would be obtained. Under the 50% gap reduction simulation, the additional 752 members in district 7620 would represent 17.8% of the membership growth for the zone (this proportion is by construction the same for the 100% gap reduction). Because of its relatively low membership rate in comparison to the expected rate, and its large high income population, district 7620 would contribute to growth in the zone in a proportion that would be larger than its current membership share, which suggests significant potential for growth in the district.

Table 7: Realized Membership Rates and Potential Membership Gain by District in Zone 33, 2010

District	50% gap reduction		100% gap reduction	
	Potential gain	RMR (%)	Potential gain	RMR (%)
7530	89	92.8%	178	86.5%

Sum	4230		8461	

Source: Author

Conclusion

This brief has presented the results of a membership potential analysis for Rotary district 7620 by geographic area. The district has one of the lowest membership rates in zone 33 in part because it includes many areas with a large number of high income households, and because membership rates tend to be lower in such areas. Still, the analysis suggests that there is potential for growth in the district, with the top five areas for growth likely to be Montgomery County, Prince Georges County, Baltimore County, the District of Columbia, and the city of Baltimore.

These results should be considered as indicative only given that alternative modeling approaches could have been used for assessing membership growth potential and would have yielded

The Nonprofit Research Project

NPRP Brief 2013/7

different results. Still, it is hoped that the analysis will be of some value for District officials developing strategies for membership growth.
