Wave function method to forecast foreign currencies exchange rates at ultra high frequency electronic trading in foreign currencies exchange markets

Dimitri O. Ledenyov and Viktor O. Ledenyov

Abstract – The accurate forecast of the foreign currencies exchange rates at the ultra high frequency electronic trading in the foreign currencies exchange markets is a main topic of our research: 1) the present state of the foreign currencies exchange markets in Asia, Europe and North America; 2) the research review on the classic forecast techniques of the foreign currencies exchange rates dynamics in the foreign currencies exchange markets in the classic finances theory; 3) the description on the quantum forecast techniques of the foreign currencies exchange rates dynamics in the foreign currencies exchange markets with the application of both the wave function and the time dependent / time independent wave equation in the quantum finances theory; 4) the derivation of the time dependent / time independent wave equation in the quantum finances theory; 5) the creation of the quantum system state prediction algorithm, based on both the wave function and the time dependent / time independent wave equation in the quantum finances theory; 6) the discussion on the developed software program with the embedded quantum system state prediction algorithm, using both the wave function and the time dependent / time independent wave equation in the quantum finances theory; 7) the final words on the perspectives of the quantum forecast techniques of the foreign currencies exchange rates dynamics in the foreign currencies exchange markets, applying both the wave function and the time dependent / time independent wave equation in the quantum finances theory.

Introduction

The ultra high frequency electronic trading is a trading process between the participating traders to trade the foreign currencies in the foreign currencies exchange markets at the time period of $10^9$ sec. The ultra high frequency electronic trading takes an advantage of the fact that the foreign currencies exchange rates change at the ultra high frequencies due to the high performance computing application, resulting in the new opportunities for the traders to make the profitable trade deals completion at the foreign currencies exchange markets. The scientific term such as the ultra high frequency electronic trading has been recently introduced in Ledenyov D O, Ledenyov V O (2014c) and the scientific term such as the high frequency electronic trading has been introduced some time ago in Goodhart, Hall, Henry, Pesaran (1993), Goodhart, O’Hara (1995), Goodhart, O’Hara (1997).

Discussing the technical realization aspects of the ultra high frequency electronic trading process, it makes sense to explain that the ultra high frequency electronic trading is usually realized with the use of the complex algorithms, which are implemented in the object oriented and sequential software, compiled by the compilers into the executable file, and executed by the operating system at the high performance computing hardware.

There are many various economic/financial/technical factors, which may have certain impacts on the change dynamics of the foreign currencies exchange rates at the ultra high frequency electronic trading in the foreign currencies exchange markets. For instance, it is a well known fact that the foreign currencies exchange rates in the foreign currencies exchange markets fluctuate at the ultra high frequencies in the frequency domain, depending on:

1. The foreign currencies supply and demand in the process of the foreign currencies trading at the in the foreign currencies exchange markets at the given time moment.
2. The propagation properties of the discrete-time digital waves (the business cycles) in the economies of the scales and scopes in the time domain at the Schumpeterian creative disruption age;
3. The technical parameters of the algorithms, used by the traders in the process of the foreign currencies trading at the in the foreign currencies exchange markets;
4. The technical specifications of the computers, used by the traders in the process of the foreign currencies trading at the in the foreign currencies exchange markets;
5. The volumes of the foreign currencies, traded at the ultra high frequency electronic trading in the foreign currencies exchange markets;
6. The frequencies of the trade deals completion at the ultra high frequency electronic trading in the foreign currencies exchange markets;

7. The characteristics of the traders’ discrete-time information absorption processes in the diffusion-type financial systems with the induced nonlinearities;

8. Some other parameters.

From the wealth management point of view, the investment of the money, professional efforts and working time in the ultra high frequency electronic trading in the foreign currencies exchange markets is a best way to increase and accumulate the enormous private/institutional wealth by the experienced investors on a global scale at the present time of the disruptive changes. In addition, the authors’ scientific opinion reflects their view on the subject that an increasing application of the electronic computing technologies in the finances opens a big number of unbounded lucrative business opportunities towards the high profitable trading deals completion in an era of the ultra high frequency electronic trading in the foreign currencies exchange markets at the time of globalization.

Having said that, we would like to emphasis that the following research topics are comprehensively discussed in this research article:

1. The present state of the foreign currencies exchange markets in Asia, Europe and North America;

2. The research review on the classic forecast techniques of the foreign currencies exchange rates dynamics in the foreign currencies exchange markets in the classic finances theory;

3. The description on the quantum forecast techniques of the foreign currencies exchange rates dynamics in the foreign currencies exchange markets with the application of both the wave function and the time dependent / time independent wave equation in the quantum finances theory;

4. The derivation of the time dependent / time independent wave equation in the quantum finances theory;

5. The creation of the quantum system state prediction algorithm, based on both the wave function and the time dependent / time independent wave equation in the quantum finances theory;

6. The discussion on the developed software program with the embedded quantum system state prediction algorithm, using both the wave function and the time dependent / time independent wave equation in the quantum finances theory;
7. **The final words on the perspectives of the quantum forecast techniques of the foreign currencies exchange rates dynamics in the foreign currencies exchange markets, applying the time dependent / time independent wave equation with wave function in the quantum finances theory.**

**Literature review on high frequency electronic trading in foreign currencies exchange markets**

Wave function to forecast foreign currencies exchange rates at ultra high frequency electronic trading in foreign currencies exchange markets

During the process of the foreign currencies exchange rates forecast at the ultra high frequency electronic trading in the foreign currencies exchange markets, the computing modeling result accuracy depends on such factors as:

1. The mathematical model meaningfulness and validity;
2. The quality of the random number generator; and
3. The technical parameters of the high performance computing system.

Therefore, a considerable research attention is paid to the development of the meaningful mathematical model, which must account for all the financial variables changes in the time, frequency and space domains as well as have to apply all the theories on the ultra high frequency electronic trading in the foreign currencies exchange markets.

Going to the thoughtful discussion on the technical issues, let us remind that the foreign currencies forward exchange rate is a sum of the two components: a foreign currencies future spot rate and a time-varying risk premium in Yu, Fung, Hongyi (2005), Ledenyov D O, Ledenyov V O (2014c):

\[
\text{Foreign Currencies Forward Exchange Rate} = \text{Foreign Currencies Spot Exchange Rate} + \text{Time Varying Risk Premium}
\]
Discussing the mathematical models, we would like to say that the existing research approaches to forecast the foreign currencies exchange rates at the ultra high frequency electronic trading in the foreign currencies exchange markets include, but not limited to, the following well known financial analysis methods and models in the classic finances science in Ledenyov D O, Ledenyov V O (2014c):

1. **Macroeconomic analysis methods**, based on:
   1) The Purchasing Power Parity model;
   2) The Uncovered Interest Rate Parity model;
   3) The Sticky Price Monetary model;
   4) The Bayesian Averaging Technique model;
   5) The Combined Forecast model.

2. **Microeconomic analysis methods**, based on:
   1) The market microstructure model;
   2) The transactions order flow model;
   3) The generalized autoregressive conditional heteroskedasticity model;
   4) The Stratanovich-Kalman-Bucy filtering algorithm model;
   5) The particle filtering algorithm model.

However, the national/global financial systems of scale and scope can be described as the discrete-time quantum systems rather than the continuous-time systems, because of their discrete-time quantum nature in view of the disruptive events influences in Ledenyov D O, Ledenyov V O (2015h, i, j, k). Therefore, the quantum finances science instead of the classic finances science has to be used with the aim to accurately characterize the foreign currencies exchange rates dynamics at the ultra high frequency electronic trading in the foreign currencies exchange markets. In other words, all the above listed research approaches, aiming to predict the foreign currencies exchange rates at the ultra high frequency electronic trading in the foreign currencies exchange markets, have a limited accuracy, because they can characterize the relatively slow changing continuous-time signals only, but not the discrete-time digital signals.

Applying the quantum macroeconomic theory in Ledenyov D O, Ledenyov V O (2015h) and the quantum microeconomic theory in Ledenyov D O, Ledenyov V O (2015j), the authors propose a new research methodology to forecast the foreign currencies exchange rates at the ultra high frequency electronic trading in the foreign currencies exchange markets, which include the following newly invented innovative financial analysis methods and models in the quantum finances science:

1. **Macroeconomic analysis method**, based on:
1) The Ledenyov wave function in the time dependent Ledenyov quantum econophysical wave equation model;

2) The Ledenyov wave function in the time independent Ledenyov quantum econophysical wave equation model.

2. Microeconomic analysis methods, based on:

1) The Ledenyov wave function in the time dependent Ledenyov quantum econophysical wave equation model;

2) The Ledenyov wave function in the time independent Ledenyov quantum econophysical wave equation model.

The time dependent Ledenyov quantum econophysical wave equation in the wave function method to forecast the foreign currencies exchange rates at the ultra high frequency electronic trading in the foreign currencies exchange markets can be written as

\[ i\hbar_F \frac{\partial}{\partial t} w_{FX} = \hat{L}_{FX} w_{FX}, \]  

(1)

where: \( i \) – the imaginary unit,

\( w_{FX} \) – the wave function of a quantum financial system, which is a mathematical function in the quantum mechanics to accurately characterize a specified state of a quantum financial system. The square of the amplitude of the wave function at a given point being representative of the probability of the system being found in that state at that point.

\( \hbar_{FX} \) – the Ledenyov constant,

\( t \) – the time,

\( \frac{\partial}{\partial t} \) – the partial derivative with respect to the time,

\( \hat{L}_{FX} \) – the Ledenyov operator to characterize the total energy of the wave function.

The time independent Ledenyov quantum econophysical wave equation in the wave function method to forecast the foreign currencies exchange rates at the ultra high frequency electronic trading in the foreign currencies exchange markets can be written as

\[ E_{FX} w_{FX} = \hat{L}_{FX} w_{FX}, \]  

(2)

where: \( w_{FX} \) – the wave function of a quantum financial system, which is a mathematical function in the quantum mechanics to accurately characterize a specified state of a quantum financial system. The square of the amplitude of the wave function at a given point being representative of the probability of the system being found in that state at that point,

\( \hat{L}_{FX} \) – the Ledenyov operator to characterize the total energy of the wave function,
\( E_{fx} \) – the energy of the state \( w_{fx} \).

It is necessary to add that we developed a software program, which uses the quantum system state prediction algorithm, based on the time dependent / time independent wave equation with the wave function in the quantum finances theory, to forecast the foreign currencies exchange rates at the ultra high frequency electronic trading in the foreign currencies exchange markets.

In addition, we successfully applied the software program, which uses the quantum system state prediction algorithm, based on the time dependent / time independent wave equation with the wave function in the quantum finances theory, with the aim to forecast the foreign currencies exchange rates at the ultra high frequency electronic trading in the global foreign currencies exchange markets.

This innovative research on the foreign currencies exchange rates at the ultra high frequency electronic trading in the foreign currencies exchange markets is done, using the following scientific literature:

Conclusion

This research article presents an original research on the following scientific topics:

1) the present state of the foreign currencies exchange markets in Asia, Europe and North America;

2) the research review on the classic forecast techniques of the foreign currencies exchange rates dynamics in the foreign currencies exchange markets in the classic finances theory;

3) the description on the quantum forecast techniques of the foreign currencies exchange rates dynamics in the foreign currencies exchange markets with the application of the time dependent / time independent wave equation with the wave function in the quantum finances theory;

4) the derivation of the time dependent / time independent wave equation in the quantum finances theory;

5) the creation of the quantum system state prediction algorithm, based on both the wave function and the time dependent / time independent wave equation in the quantum finances theory;

6) the discussion on the developed software program with the embedded quantum system state prediction algorithm, using both the wave function and the time dependent / time independent wave equation in the quantum finances theory;

7) the final words on the perspectives of the quantum forecast techniques of the foreign currencies exchange rates dynamics in the foreign currencies exchange markets, applying the time dependent / time independent wave equation with the wave function in the quantum finances theory.

Acknowledgement

The first author started his scientific work on the information processing in Kharkiv, Ukraine, researching the microwave filters, making the discovery that the quantum knot of the magnetic vortex is in an extreme quantum limit, focusing on the research and development toward the ultra dense memory on the quantum knots of the magnetic vortices, and presenting his innovative research results at the international conferences, including the Marconi seminar at Birmingham University in the UK in 1999.
The advanced innovative research on the analog and digital signals processing at ultra high frequencies in the electronics engineering and physics sciences has been conducted by the first author under Prof. Janina E. Mazierska at James Cook University in Townsville in Australia in 2000 – 2015.

The first author would like to tell an interesting story that he decided to fly from James Cook University in the City of Townsville in the State of Australia to University of Czernowitz in the City of Czernowitz in the State of Ukraine to pay his respect to Prof. Joseph Alois Schumpeter’s scientific achievements in March, 2015, because Prof. Joseph Alois Schumpeter started to think on the business cycles and economic development in the economics science at University of Czernowitz in the City of Czernowitz in the State of Ukraine in 1909 – 1911, completing the writing of his well known book on the business cycles in Schumpeter (1939).

It may be interesting to note that the first and second authors were graduated from V. N. Karazin Kharkiv National University in the City of Kharkiv in the State of Ukraine in 1999 and 1993. The V. N. Karazin Kharkiv National University, was founded in 1805 in Kharkiv, Ukraine, becoming a leading high educational institution in Europe in IX-X XXI centuries. Let us remind that Prof. Tugan-Baranovsky, who originated the business cycle research, was graduated with his first technical degree from V. N Karazin Kharkiv National University in Kharkiv, Ukraine at the end of IX century. Prof. Nikolai D. Kondratiev, who is well known for his groundbreaking research on the business cycles, considered Prof. Tugan-Baranovsky as his most respected Teacher. At later date, Prof. Simon Kuznets, obtained his high degree and conducted his scientific work on the cyclical fluctuations in the economic systems in the City of Kharkiv in the State of Ukraine in 1915 - 1922, being influenced by Prof. Joseph Alois Schumpeter and Prof. Nikolai D. Kondratiev research ideas/papers and coming up with the remarkable research results, published at Harvard University in the USA, in Kuznets (1930, 1973).

It is a notable historical fact that the first and second authors were strongly influenced by the remarkable scientific papers and books by Lev Davydovich Landau, who had a considerable interest in the physics and, at the later stage of his life, in the econophysics, working at National Scientific Centre Kharkiv Institute of Physics and Technology / V. N. Karazin Kharkiv National University in the City of Kharkiv in the State of Ukraine in 1930s.

The second author began his research work on the information processing, specifically focusing on the information processing and coding by various electronic computing devices in Ukraine in the later 1980s and early 1990s. The second author made his significant research contributions to establish the scientific field on the information processing by the quantum computing devices, researching and developing the 1024 Quantum Random Number Generator
on the Magnetic Flux Qubits, based on the Superconducting Quantum Interference Device (SQUID) arrays, for the space applications at a number of leading research institutions and elite universities in Europe and in North America since the beginning of 1990s. The second author is frequently regarded and commonly recognized as a founder of the research field on the information processing by the superconducting quantum computing devices, which was established in Europe almost 30 years ago.

In the quantum computing, the second author’s scientific views were mainly influenced 1) by Prof. Lev Landau research papers on the quantum physics, which have been absorbed during his research work in the City of Kharkiv in the State of Ukraine in 1990s; and 2) by Prof. Niels Bohr research articles on the quantum physics, which have been studied during his scientific work at Technical University of Denmark in the City of Lyngby near the City of Copenhagen in the State of Denmark in Scandinavia in 1995, 1997-1998; and 3) by Prof. Heike Kamerlingh Onnes research discoveries, which have been researched during his scientific visit to Leiden University in the State of The Netherlands in 1998.

Discussing the scientific problems on the signal generation, it is necessary to comment that the second author completed his research on the Gunn diode microwave generators in 1991-1992 at V. N. Karazin Kharkiv National University in Kharkiv, Ukraine, and then continued his innovative scientific work on the various scientific programs towards the continuous-time waves generators such as the Yttrium Iron Garnet (YIG) microwave generators, tuned by the magnetic field, as well as the discrete-time digital signal generators such as the 1024 Quantum Random Number Generator on the Magnetic Flux Qubits, based on the Superconducting Quantum Interference Device (SQUID) arrays, the superconducting microwave resonators, among other research programs during the last three decades. In addition, the second author has developed a plenty of experience in the discrete-time digital signal generators, using the digital modulation techniques such as the Pulse Amplitude Modulation (PAM), Quadrature Amplitude Modulation (QAM), Phase Shift Keying (BPSK, QPSK, MPSK), Frequency Shift Keying (FSK), Gaussian Minimum Shift Keying (GMSK), etc.

The second author has been greatly influenced by the Henry George’s scientific ideas, articles and books in the economics since the beginning of 1990s. The second author has had the numerous opportunities to discuss a wide range of research problems in the economics during his frequent visits to the international conferences and his intensive research work at leading universities in Europe and North America during last four decades.

Let us repeat that this innovative research uses the knowledge on the analogue and digital signals processing in the physics and the electronics engineering, which is described in

The final writing, editing and reading of our research article have been made by the authors during our travel to the Prof. Viktor Yakovlevich Bunyakovsky motherland in the Town of Bar in Vinnytsia Region in the State of Ukraine in the beginning of May, 2015 and August, 2015.

The additional research changes have been added by the authors during the visits to the City of Kharkiv in the State of Ukraine in June / July / September, 2015. The obtained research results have been extensively discussed with a number of prominent scientists at the VII International Economic Forum: Innovations, Investments, Kharkiv initiatives at Kharkiv Palace hotel in Kharkiv, Ukraine on September 4, 2015; and at the International Economic Conference: Tugan-Baranovsky’s Scientific Heritage and Modern Economics Science at V.N. Karazin Kharkiv National University in Kharkiv, Ukraine on October 15-16, 2015.

The authors’ vision is that the leading universities continue to educate the students to and make the research in the old meaningless theories in the classic economics science and the classic finance science, which can not explain the functional principles of the real national economies of scale and scope, because of the imposed scientific limitations. We think that the modern theories in the quantum economics science and the quantum finance science can only explain the functional principles of the real national economies of scale and scope meaningfully.

Let us make a final comment by saying that, in the time of the unlimited presence of and access to the information, knowledge and creative integrative thinking around the Globe, we do believe that the new innovative discoveries in the science and technology could be generated by the talented scientists and inventors at any place in our global increasingly multi-polar World at any time.
