Trump's tariff's impact on Africa and the ambiguous role of African agency

Dirk Kohnert ¹

The international discussion of Trump's dispute over import tariffs for steel, aluminum and even cars are so far focused on the big global players. However, smaller African countries in particular suffer too from the planned punitive tariffs, similar to the famous African proverb, "When elephants fight, it is the grass that suffers". After years of talk on partnership for economic development (AGOA, Cotonou Agreement, EPAs, etc) Trump's tariffs mean a severe blow to participatory foreign trade and sustainable industrialization in Africa. Egypt and South Africa for example, the potentially most affected African countries, face massive job losses and earning opportunities, with all the consequences that this entails for their already fragile economy and the population in dire poverty. Trump's intervention thus joins the continued power politics of former colonial powers vis à vis Africa. Nevertheless, despite these asymmetric power relations, unfair trade relations and the desolate state of African infant industries are not necessarily due to externalities but often home-made. African agency plays an ambiguous role in enhancing participatory trade and indigenous industrialization.

JEL classification: F13 - Trade Policy ; International Trade Organizations, F51 - International Conflicts ; Negotiations ; Sanctions; F52 - National Security ; Economic Nationalism, F6 - Economic Impacts of Globalization, H21 – Efficiency, Optimal Taxation, N 67 – Economic History, Manufacturing, Africa; N – 77 Economic History, Trade, Africa, P16 - Political Economy, P52 - Comparative Studies of Particular Economies, Z1 - Cultural Economics, Economic Sociology, Economic Anthropology

The current debate on Trump's tariffs focuses on the big global players and competitors of the US. Africa plays virtually no role in the international scholarly perception about the impact of US protective tariffs on imported steel, aluminum and cars. Nevertheless, there are such effects and these are anything than peanuts, as will be shown in the following.

1. Impact of Trump's tariffs on African trade

At least since the derogatory comments of the American President on Africa in January 2018, in which Donald Trump described African states as "shitholes", the

¹ Associated senior expert at Institute of African Affairs (IAA), GIGA, German Institute of Global and Area Studies, Hamburg, Germany. Retired deputy director of IAA (1990-2011). – paper submitted to ASAI V – Fifth conference of the Association for African Studies in Italy, *PluralAfrica*, Dept. of Political and Social Sciences, Univ. of Bologna, 5 – 7 September, 2018, Panel 8: Africa at the crossroads – global circulation and local specificities. – Draft: Not to be quoted without permission of the author, June 19, 2018.

weight he attached to Africa became clear beyond doubt². Evidently, from his point of view, America's greatness is based on other spheres of influence than Africa. This is in disregard to the fact that Africa and the African diaspora contributed significantly to the making of the United States, to its development into the country that it is today, as Clayson Monyela, a spokesman for the South African Department of International Relations and Cooperation underlined recently³. Trump rather concentrates on global competitors, such as China, Russia and Europe in order to 'put America first again'.

In absolute terms Trump may be right. The dimension of imports of steel and aluminum from Africa might be negligible in relation to overall imports and its supposed negative effects on employment of US working-class whites in Rust Belt states, such as Pennsylvania, Michigan, Wisconsin and Iowa, who belong to the clientele of Trump's republican voters.

However, Africa is far more dependent on overseas trade than other economic regions and global players, such as the EU or North America that handle 63% and 40% respectively of their business with their regional neighbors, like the EU member states, Mexico and Canada. Major reasons of Africa's dependency are the fragmented intra-African market, decades of stagnant regional and continental integration, high transaction costs, and corresponding tariff and non-tariff barriers to trade. Most of these barriers are at least partially due to rival neo-colonial foreign trade networks of anglo-, franco- and lusophone African countries, like that of the French 'Messieurs Afrique' (Kohnert, 2005).

Africa's infant industries rely heavily on foreign trade in view of its limited local and regional markets. Intra-African trade accounts for far below 20% of total African foreign trade. The Pan-African Free Trade Agreement (CFTA) that was recently negotiated on a special AU summit in Kigali (Rwanda, 21 March 2018) by 44 African states is not likely to change this situation in the foreseeable future. CFTA is supposed to liberalize intra-African services completely and 90% of trade in goods. Yet, the common external tariffs have not yet been negotiated, last, but not least, because of controversial EU-Africa trade agreements (EPAs, Kohnert 2015), and since some of the major African countries, for example South Africa, Nigeria and Uganda, have not yet joined the CFTA.

Finally, unfair trade relations to the disadvantage of African countries overshadow African foreign trade since colonial times. Africa is still integrated asymmetrically into global trade. Raw material and agricultural exports on the one hand and capital goods imports on the other still dominate African foreign trade. One of the origins of Africa's current inability to benefit fully from the expansion of world trade lies in the colonial division of labor, the consequences of which persist in economic structures

² Greef, Kimon de & Sewell Chan (2018): [Trump Comments, Infuriating Africans, May Set Back U.S. interests](#). New York Times, Jan. 15, 2018

³ Ibid

far more than in other continents (Barratt Brown, 2007). Under these conditions, the free trade ideology of the Bretton Woods Institutions, propagated for decades by Structural Adjustment Programs of the IMF, rather conserved the status quo than sustainable African growth. This the more so, as Africa's commodity prices have fallen in international markets since the 1970s, whereas at the same time consumer prices have risen. The divergences increased dramatically because of the asymmetric response of domestic consumer prices to movements in world prices⁴. This imbalance had been commonly attributed to trade restrictions and rising processing costs. But in reality it appeared to be caused largely by the behavior of international trading companies large enough to dominate most commodity markets (Morriset 1997). All this makes for the volatility of African foreign trade relations that would still be aggravated by Trump's tariffs.

Still, Africa is mostly ignored in the international scholarly discussion about the effects of Trump's protective tariffs on steel (25%), aluminum (10%), cars and other imports. Trump's "trade war" meanwhile extended to far more than steel and aluminum. Concerning US steel imports, South Africa ranks only 20th on the global list of steel exporting countries, far behind Germany (8) or China (10) (see Table 1, Map 1). However, in Africa there are also countries and sections of the population that would suffer significantly from the new protective tariffs planned by the US government supposedly to safeguard 'national security', as will be shown below.

Besides, the following examples of African countries, who have little power to retaliate, show that Trump's protectionism is inspired not only by economic and 'national security' reasons, which may be allowed for by WTO regulations, but also by considerations to enforce good conduct of trading partners in order to 'make America great again' which are obviously illegal according to WTO rules⁵. It went to such length to punishing Africans for refusing second-hand American clothes. The case in question concerns Rwanda that, like many other African countries, was once a proud producer of home-made textiles. But decades of mismanagement, instability, the market liberalization of the 1980s and the subsequent global competition with cheap Chinese imports and overstocking African markets with used clothing from overseas brought African local textile industry to its knees⁶. Therefore, the East African Community (EAC) decided in 2015 that second-hand apparel would be banned from their markets from 2019. In retaliation, the US threatened in 2017 to remove four East African countries, Kenya, Uganda, Tanzania and Rwanda, from the African Growth and Opportunity Act (AGOA)⁷, because its declared aim is to eliminate trade barriers.

⁴ Nigeria, Egypt and South Africa, for example, counted among the major losers in terms of export losses by unfair trade in the commodity markets for petroleum, rice and wheat in the past decades. Morriset 1997: 22

⁷ AGOA was introduced in 2000 by the Clinton administration to boost trade and investment in granting Africa duty-free access to 6,500 exported products. The purpose of this legislation was "to assist the economies of sub-Saharan Africa and to improve economic relations between the United States and the region. After completing its

Whereas subsequently Kenya, Uganda and Tanzania backed out, Rwanda did not, in order to protect its nascent garment and textile industry⁸.

Steel and aluminum-production and –imports to the USA

The USA is the world largest importer of steel and aluminum. In 2017, it imported 34.6 metric tons (mmt) steel. Due to growing productivity, the US is producing more and more steel with fewer and fewer workers. Just under 300,000 workers were employed in the US steel sector in 2015, with a decreasing trend, to the current level of 8.5% of the workforce in the manufacturing sector. The volume of imported steel in the United States in 2016 was 15% higher than that of Germany, the second largest steel importer in the world. Although steel imports to the USA were distributed over 85 countries, just four exporting countries, Canada, China, Russia and the United Arab Emirates were by far the most important suppliers (75%) of steel to the USA, none of them African.

With regard to aluminum the dependency of the USA is even more pronounced (map 2) and this dependency increased steadily within the past decades. About 90% of its aluminum for products, as diverse as beer cans and aircraft, the US covers by now by imports. While there existed still 23 aluminum smelters in the US in 1993, there are only five today. Just one of them is capable of producing high purity aluminum, which is needed for aircraft construction⁹. However, the jobs in the aluminum smelter industry which Trump wants to protect constitute only 3% of total jobs in the aluminum industry. The remaining 97% (about 156,000) are in the downstream manufacturing industry¹⁰. The US business already warned against an ugly trade-off. That is, increasing tariffs would also raise prices in the US automotive and aviation industries, making their jobs less competitive internationally.

Economists worldwide warn against a trade war (Lim, L. 2018; Malawer, 2018; Pelkmann, 2018; Peterson, 2018). They do acknowledge that the global overproduction of steel and aluminum is a problem that needs to be solved. Nonetheless they do also raise concerns that in restricting free markets rules by unilateral taxation of imports as envisaged by Trump, the Trump administration not only violates WTO rules, but would also cause lasting damage to the global economy. Moreover, economists caution that Trump's protectionism could spread to

initial 15-year period of validity, the AGOA legislation was extended on 29 June 2015 by a further 10 years, to 2025” ([African Growth and Opportunity Act](#), Wikipedia)

other industries and countries¹¹. However, they admit that the world trade system, and in particular US-EU trade relations, urgently need to be reformed, especially as the EU has built more trade barriers in recent decades than the US¹². Moreover, African economists give notice of collateral damages of a possible trade war between the major global players, notably a negative impact on productive capacity and jobs for Africa's infant industries¹³.

Steel production in the US and Africa in comparison

The steel production (in 1,000 tons) in the USA in January 2018 was 6,822, i.e. about ten times as high as in Egypt (660) or South Africa (577). Other major African steel exporters like Libya (48) and Morocco 45 (Aug. 2017) were far behind in third and fourth place, respectively¹⁴. Worldwide, South Africa and Egypt rank 22nd and 27th globally in steel production, that is, far behind China, the world's largest steel producer, with 808.4 million mmt or 50% of world production. Still, barely 2% of the steel imported into the US last year came from China¹⁵. Share levels in aluminum were a bit higher, but not predominant either. The vast majority of Chinese steel shipments went to other countries. Trade diversion as result of Trump's protective tariffs could lead to the dreaded crowding out and cut-throat competition with respect to the infant African steel industry.

However, compared to the US, China or Europe, the metalworking industry in African countries, such as South Africa or Egypt, has a significantly higher importance for its domestic economy and sustainable growth. In total, the manufacturing industry in South Africa had 1,213,560 employees in 2014, of which the largest share was in the metalworking industry, namely 257,098 or 21%¹⁶. In Egypt, the total number employed in industry¹⁷ in 2015 was 25% of all economic sectors, with its steel industry considered to embody the nation's economic resilience¹⁸.

¹⁴ For decades, Nigeria could only meet its own needs for steel through imports, a. o. because of the unbelievable mismanagement of the gigantic Ajaokuta Steel Mill Project (1979 - 2017) for decades. Although Nigeria, with an annual production of approx. 1 million mmt, is now one of the major steel producers in Africa, it did not start to export steel until 2017, namely 150 - 200,000 mmt p.a. to Ghana, Ivory Coast, Egypt and Morocco. "Nigeria enters league of steel exporters", Vanguard, Nigeria, 19.10.2017. Nigeria's aluminum exports - mostly to Japan - were \$ 134.9 million in 2016, 63111 tons p.a. with an upward trend. But they accounted for only 0.4% of total Nigerian exports. Steel and aluminum production in Egypt and South Africa and US imports

Egypt

Egypt exported about 170,000 tons or \$ 102 million worth of steel to the United States in 2017, accounting for about 3% of total US imports, with rising tendency. The potential for a further increase in Egyptian steel exports was estimated by the metallurgical chamber of industry of Cairo (MIC) as promising¹⁹. Not only did the MIC plead to be exempted from Trump's duties, she also hoped for a crowding out at the expense of third parties. According to the MIC, Egyptian exports to the United States could even continue to increase and take the place of those countries that were unlikely to be exempted from US tariffs, such as Turkey. The latter exported 2.5 m tons of steel to the US in 2017. Egypt's total foreign trade with the US rose 13% in last year, from \$ 4.7 billion in 2016 to \$ 5.5 billion in 2017. Egypt's Trade Minister Tarek Kabil recently stated that his country's steel exports accounted for only 6% of total exports and that there would be still plenty of room for maneuver. Yet this apparently was wishful thinking, because Egypt was on the list of 12 countries²⁰ of the US Department of Commerce to be punished for alleged dumping or unfair trade with especially high tariffs. According to the US-report on "*The Impact of Imports of Steel on National Security*", the first option embraced a global protective tariff of 24%. The second option included Egypt, along with 11 other states. For these 12 countries, a penalty of at least 53% on steel imports was recommended. Egypt would thus be much more affected by the punitive tariffs than, for example, the EU. Thousands of steel workers would be unemployed. Egypt could relieve itself from US import duties – if at all - only with extraordinary foreign policy concessions, for example concerning Israel, which - because of Egypt's lower bargaining power - would probably be far more serious than similar concessions of the EU or Germany.

South Africa

South Africa, also benefitting from AGOA, is the most important African exporter of steel to the U.S. South African steel imports to the US totaled \$ 950 m, and aluminum exports \$ 375 m in 2017. Though, they represented only about 1.4% of total US imports, but a quarter of all South African US exports. Losing the US market could put 300 000 tons of steel production at risk, along with some 7 500 jobs in the steel and manufacturing supply chain. The US market for aluminum produced in South

¹⁹ „Trump steel tariffs: Harming Egypt's exports? Al-Ahram Weekly, [ahramonline](http://ahramonline.com), 19.03.18. However, only two of several manufacturing Egyptian companies are currently exporting steel to the US: Ezz Steel and Kandil Steel - Egypt does not export aluminum to the US.

²⁰ Egypt, Brazil, China, Costa Rica, India, Malaysia, Russia, South-Korea, South-Africa, Thailand, Turkey, Vietnam.

Africa were valued at \$375-million, accounting for 1.6% of US imports ²¹. This illustrates quite well the asymmetric distribution of the risk to lose jobs in both countries. According to the South African Trade and Industry Department (DTI), its exports were not an unfair trade or a threat to US industry or jobs. Rather, they would serve as input to the US manufacturing industry, helping to create jobs and increase US production²². Nevertheless, South Africa was also on the list of the 12 countries that were to be subject to particularly high punitive tariffs, mentioned before. Amongst the steel companies concerned were for example ArcelorMittal SA. and Hulamin, a Pietermaritzburg-based company that supplies aluminum products for Elon Musk's Tesla (the Californian electric-car maker), that could also be affected. ArcelorMittal's and Hulamin's share prices lost 5% and 4%, respectively, on the black Friday after the announcement. The local South African steel industry also feared that the US could use the ongoing protective tariff discussion as a springboard to levy tariffs on processed products, especially motor vehicles. Yet, vehicle manufacturers such as BMW and VW South Africa downplayed the problem. VW for example was pointing out that they did not export cars from South Africa to the US. Nevertheless, the government in Pretoria did apply for exemption from US tariffs in March 2018²³. This, the more so, since the South African steel industry was already suffering from global overproduction and low world market prices and jobs were under massive risks. Trump's threats also influenced the exchange rate of South African's currency, which depended on car exports. The Rand gave up overnight on R11.88.

African experts fear that - according to the African proverb, if two elephants are fighting, it is the grass that suffers - especially the globally smaller countries could suffer most from the trade conflict between the US, and global players like China or the EU, notably Germany, that were singled out by Trump for allegedly having "taken advantage" of the United States²⁴. This all the more so, as South Africa is not such a significant US ally that it would be exempted from sanctions, such as Canada, Mexico, Australia, Argentina or South Korea. The South African government learned end of April that the US had not granted South Africa an exemption on its increased steel and aluminum tariffs from across-the-board 25% steel and 10% aluminum tariffs. Just before, SA had offered to restrict exports of these metals to the US to 70% of the 2017 level, but the Americans had turned down this proposal. Apparently, this was also a foreign policy motivated retaliation measure of the US after its recent announcement that it wanted to cut foreign aid to countries like South Africa who don't vote with it at the UN ²⁵. All the more, Trump announced end of May that the US Commerce Department was investigating possible trade actions on imported vehicles of about 25% tax on imports for cars and trucks. In 2017, the US imported almost

²⁵ Helena Wasserman: [Trump's latest snub of South Africa will hurt locals – and more pain could be coming, warns a trade expert](#). *Business Inside, South Africa*, May 1, 2018.

37,000 cars from South Africa. Thus, it was the second biggest importer of SA vehicles, after the UK (54,400)²⁶. Up to now, South African car manufacturers had duty-free access to the US market because of AGOA – which apparently will be also questioned by Trump in the long run.

Accordingly, South Africa will be disproportionately affected both in terms of jobs and productive capacity, although the SA-trade department pointed out that some of the exempted countries are the “biggest” exporters of steel and aluminum to the US. According to the department the exempted countries accounted for 58% of steel imports and 49% of aluminum imports to the US in 2017. “South Africa is therefore not a cause of any national security concerns in the US nor a threat to US industry interests and is not the cause of the global steel glut.” “Instead, South Africa finds itself as collateral damage in the trade war of key global economies. South Africa is concerned by the unfairness of the measures and that it is one of the countries that are singled out as a contributor to US national security concerns when its exports of aluminum and steel products are not that significant,” the DTI complained²⁷.

2. Ambiguous role of African agency in fostering participatory trade and development

African Civil Society Organizations as driver of change

The current dispute on the negative impact of Trump’s tariffs is only the most recent manifestation of a longstanding controversy between African countries and their Western trading partners. The debate was confined by the framework of the Cotonou Agreement (2000), a cornerstone of EU-ACP²⁸ development cooperation on the one hand and limiting WTO rules on the other. The Cotonou Agreement was built already on generations of cooperation treaties since 1963, when most African countries had gained independence. At this time, the European Economic Community (EEC) developed a first generation of economic cooperation agreements, mainly with French-speaking African countries, the so called Yaoundé Convention²⁹, later-on extended to the Lomé Convention (1975-1999). The new EU-ACP partnership is not restricted to governments. Civil society organizations, could participate too, as well as economic and social partners and the private sector.

Fortunately enough, social movements in Europe and Africa have arisen to contest imperial globality, fostering forms of counter-hegemonic praxis and politics against

the imposition of neoliberal globalization (Prempeh, 2006). The ongoing EPAs controversy on the Economic Partnership Agreements (EPAs) between the EU and Africa and the increasing impact of African agency on negotiations with the EU is a prominent example (Kohnert, 2014).

Building up civic agency³⁰ is not only crucial for a sustainable process of democratization but also for foreign trade on a level playing field. The development potential of civic agency in African countries and elsewhere depends on internal and external variables which are interdependent. The domestic factor rests to a large extent on the capacity of citizens to overcome fault lines of ethnicity, class, gender, religion and partisan politics in their own country. However, this domestic capacity can be enhanced also by global developments and networks like the spread of internet and mobile phones even in remote regions all over Africa, by international advocacy networks, and last but not least by motivating successful protest movements in neighboring countries, like the Arab spring or the wave of Sovereign National Conferences in Sub-Saharan Africa in the early 1990s.

Foreign influence on the development capacity of civic agency, both positive and negative, is often indirect and accidentally, but not necessarily less effective. In many cases it is not visible at first sight, notably when it comes to its long-term effects. More often than not, it slips in under the radar screen of even well-intended aid-donors because the institutional memory both of development agencies and related research and evaluation institutions is usually quite short (Bierschenk / Elwert / Kohnert 1993). In contrast, the aftermath of misguided development policies and failed development projects remains often embodied in the memory of the local population concerned over generations. However, its long-lasting impact is considered by the donors only occasionally if at all (Kohnert 2017).

We can draw valuable lessons from civic agency in the realm of participatory trade politics in West Africa and elsewhere. They date back up to the [Seattle protests of 1999](#), which became a global symbol of civic agency by questioning the legitimacy of the WTO order. This was shown by Silke Trommer (2014) in her painstaking study of West African civil society organizations (CSOs) as symbols and innovative drivers of transparency and democratization in ECOWAS's EPA negotiations. Originating in the late 1990s, "national platforms of civil society organizations" dealing with ACP–EU relations have, since 2006, become officially recognized by, and deeply involved in ECOWAS–EU talks. Fluctuating over time, these CSOs comprised 15 organizations from 11 West African countries (in 2009) composed of a vast variety of groups, such as farmers' associations, local and transnational NGOs, trade unions, women's rights associations, etc. Each national member was responsible for lobbying at its

³⁰ The normative concept of 'civic agency' is not straightforward. It is related to Western rights-based views, notably, on the relationship between polity and the state in general and democracy in particular (Fowler 2009:150-151). Thus, the ascription of civic agency is dependent last, but not least on power relations on the continuum from a local to a global order.

respective national level. Although the degree of legitimacy and representativeness varies considerably among members, together they wield a remarkable political, social and economic influence, including access to core trade policymaking institutions like ECOWAS and the official EPA negotiation table.

African Agency as impediment to sustainable development

Unfortunately however, more often than not, African agency has been impeding sustainable trade and development of African countries, as will be shown in the following. In comparison, the set-back that Trump's protective tariffs effected on US-African trade-relationships are by far less important than self-inflicted barriers of African agency, namely large-scale corruption, nepotism, and mismanagement on all levels of politics, economy and society. Scholarly studies on these impediments of development and the peculiarities of African 'states at work' are legions (Bierschenk et al 2014; Justesen & Bjørnskov 2014; Blundo & Sardan 2006). However, let us bear clear about it right from the start: African institutions and persons are not the only one to blame for this, more often than not they are closely entangled with their Western counterparts.

Informal institutions play a decisive role in African bureaucracies, politics, economy and society. However, there exists nothing like a typical African culture of corruption, clientelism or mismanagement. Most cases of grand corruption in Africa for example have been instigated by globally acting corporations³¹. This was beneficial for the briber too in many respects, not just to secure lucrative business contracts. In Germany, for example, the tax office classified bribes as so-called 'useful expenses' up to 1997. Therefore, they could be deducted as business expenses from the tax. The only precondition was that the recipient abroad was named. Most industrialized nations had similar regulations³². The trend to treat bribes to foreign officials ever since as illegal does not necessarily mean that grand corruption has been confined.

Besides, even African ethnic patronage relations, are neither primordial nor divisive but instead continually adapted to modern requirements (Meagher 2006). Seemingly static cultural factors, such as custom, tradition, religion, or ethnicity, have been re-invented or adapted to changing requirements of societies. Therefore, it would be misleading to put the blame for lacking development in Africa on the cultural heritage, as supposedly incorporated in "traditional African institutions", which are frequently considered in a simplistic and deterministic manner as customary barrier to

³¹ A recent example was the prosecution of French billionaire Vincent Bolloré, owner of one of the largest transport and logistic operators in Africa, for 'bribing foreign public officials' in Lomé and Conacry, in order to obtain two lucrative container terminals in Lomé and Conacry. Agnew, H. (2018): [Vincent Bolloré in French police custody after Africa probe. Billionaire detained as part of bribery investigation](#) London: Financial Times, April 24, 2018

³² OECD (2011): [Update on tax legislation on the tax treatment of bribes to foreign public officials in countries parties to the OECD anti-bribery convention](#). Paris: June 2011.

democratization or economic growth. In addition, there exist significant structural differences not only between cultures of innovations of the formal and the informal sector, but also within the informal sector, depending on its social structure. Both differences have serious repercussions with regard to the developmental trajectory. Last, but not least, the fault lines between the formal and the informal become increasingly blurred in various ways by globalization. This has been demonstrated with respect to different standards for culturally induced innovations between the so-called “useful” and “useless” development regions by Ferguson (2006:380), who took “governance” and investment criteria concerning strategic investments of oil-multinationals as examples. The enclaves of the “useful” Africa are not any longer delimited either by national frontiers, or by the divide between the formal and informal, but by boundaries of transnational economic and social spaces. The chains of transnational enclaves of “useful Africa”, e.g. of oil fields exploited by oil multinationals in West Africa (often backed by powerful hidden national interest), function apparently according to rules and ethics beyond the official discourse on governance or on codes of conduct of international development cooperation. The poor in these regions are regularly excluded from the “useful Africa”, as shown by the example of the Niger Delta. They have to obey special laws, which result in their exclusion and marginalization within the context of globalized capitalism.

Obstructing African agency: the example of the Ajaokuta Steel Mill Project, Nigeria

The Ajaokuta Steel Mill project is the second largest steel mill in Africa, and the 12th largest in the world. However, at the same time it is one of the most infamous ‘white elephants’ in Africa too (SaharaReporters, 2018; Faboyede, O.E. 2015). Construction started in 1979 under a co-operation agreement with the former Soviet Union on 24,000 hectares in Ajaokuta, Kogi State, Central Nigeria. The project has four different types of rolling mills inside the plant to produce different steel products. Its coke oven and by-product plants, allegedly completed in 1994 to up to 98%, or 40 or 43 plants, were bigger than all similar plants in Nigeria combined. In order to supply the mill with iron ore and connect it with the world market, Nigeria's first standard gauge railway was built from the iron mines at Itakpe to the steel mill at Ajaokuta and continuing to the Atlantic Ocean at Warri. The railway was nearly completed too, but part of it was vandalized in the meantime (Ajaokuta Steel Mill, wikipedia).

Ajaokuta would have had the capacity to become one of the major African producers of industrial machineries, auto-electrical spare-parts, shipbuilding, railways and carriages, as well as biggest African supplier, not just for neighboring African markets. In the first phase of its development the plant would have provided direct employment for 10,000 workers and further 500,000 up- and downstream if in operation. When, after several failed attempts of privatization, the Nigerian government took back control in 2016, it had spent an estimated US \$10 billion over 34 years on the project. However, not a single sheet of iron has been produced till

date because of gross mismanagement, fraud and vandalism of the plant in the course of failed privatization efforts (Faboyede, O.E. 2015). About still another \$ 1.5 billion would be necessary to complete the remaining two per cent of the plant (Oluyole, F. 2017; Ajaokuta Steel Mill, wikipedia). That is, \$625 million to complete the steel company and another \$ 800 million to provide the external infrastructure, including railway, for the complex, to make it operational³³. Yet, apparently some ministers in the former Goodluck Jonathan as well as the present incumbent Muhammadu Buhari's administration were again trying to fraudulently acquire the Ajaokuta steel company for themselves, as was revealed in a detailed petition read at the House of Representatives in Abuja in March 2018 (SaharaReporters, 2018).

Conclusion

African states still strive to cope with the legacy of the slave trade, colonialism, and the subsequent struggle for political and economic independence in a crisis prone continent. Decades of development aid and well-intentioned though not necessarily altruistic treaties to promote development by trade, like the for mentioned AGOA and the ACP-EU Cotonou agreement which runs out in 2020, were steps in the right direction. Yet, they apparently had little effect to accelerate the development process in Africa up to now. The present move of the Trump administration to put 'America first' and to concentrate on the 'real friends' of the US, seems to be a step backward to the times of the cold war, according to the maxim, if you're not with us, you're against us³⁴. The punitive tariffs introduced among others on imports from African countries means blunt power politics without regard to the needs of African developing countries. Yet, unlike competing global players, targeted by Trump, African states lack the power to retaliate. It is a slap in the face of those bona fide Africans who thought there would be more level playing field with the US, at least since the AGOA-treaty and the great expectations aroused by the Obama-administration (Laymann et al 2009).

Nonetheless, African institutions are no passive agents who sit mesmerized like rabbits before the snake vis à vis any move of the US government. African agency matters, despite popular misconceptions about global players as agenda setters that still prevail, whereas Africans are considered as more or less helplessly overrun and outwitted. On the contrary, local agency and class policy are central determinants of socio-economic transformations. African agency from below can develop under certain conditions to social and economic change of revolutionary proportions as the

³⁴ In railing against countries that had "taken advantage" of the United States, as allegedly Germany did, Trump said: "We have some friends and some enemies where we have been tremendously taken advantage of over the years on trade and on military ... So we view trade and we view the military, and to a certain extent, they go hand in hand." AFP, 2018, *ibid*.

'Arab spring revolutions' showed, just as the surprisingly successful role of civic agency in the EPA negotiations (Kohnert, 2014). On the other hand, the closed shop of the 'Messieurs Afrique' in Francophone Africa (Kohnert, 2005) as well as an 'agency as corruption' (Taylor, 2014), incarnated by the Nigerian example of decades of bad governance, both to the benefit of political and economic elites in Africa and overseas, still constitute an effective barrier to sustainable African development.
