Mitigating externalities of terrorism on tourism: global evidence from police, security officers and armed service personnel**Simplice A. Asongu & Jacinta C. Nwachukwu**

January 2018

Abstract

In this paper, we investigate the role of security officers, the police and armed service personnel in dampening the effect of terrorism externalities on tourist arrivals. The temporal and geographic scopes are respectively 2010-2015 and 163 countries. Four terrorism measurements are used. They include the number of: incidents, injuries, fatalities and property damages. The main findings indicate that armed service personnel can effectively be used to modulate the damaging influence of all four terrorism externalities in order to achieve a positive net effect on tourist arrivals. Conversely, the corresponding moderating role of security officers and the police is not statistically significant. Moreover, violent demonstrations and homicides have a harmful effect on tourist arrivals while the number of incarcerations displays the opposite effect. Policy implications are discussed.

JEL Classification: D74; Z32; Z38

Keywords: Terrorism; Peace; Tourism

1. Introduction

The positioning of this study builds on three main tendencies in academic and policy-making circles. They are: (i) the growing challenge of terrorism across the world, (ii) the policy relevance of tackling the consequences of terrorist attacks on economic development outcomes and (iii) gaps in the tourism literature.

First, with respect to the evolving challenge of terrorism, in recent decades, the phenomena of terrorism has been on the rise across the globe. The burgeoning phenomenon has partly been fueled by the 2011 Arab Spring and corresponding negative externalities (GTI, 2014; Asongu *et al.*, 2018a).

Second, the policy importance of addressing the negative externalities associated with terrorism fundamentally builds on corresponding costs and consequences. On the one hand, terrorists' activities inflict substantial adverse consequences on economic development outcomes. On the other, the cost of fighting terrorism is relevant to policy because the alternative investments forgone could be spent within the framework of socio-economic investments that are imperative for the achievement of sustainable development goals in the post-2015 development agenda.

Third, the literature on tourism has largely focused on the determinants of tourism without investigating how the destructive influence of such violent activities could effectively be mitigated with policy variables (Saha & Yap, 2013; Alvarez & Campo, 2014; Mehmood *et al.*, 2016). This study departs from this existing literature by focusing on how the adverse consequences of policy syndromes (such as terrorism externalities) on tourism could be effectively modulated with policy variables (in terms of the forces of law and order). Four policy syndromes in terms of terrorist outcomes are selected, involving the number of: incidents, injuries, fatalities, and property damages. In addition, the modulating impact of two main policy variables are investigated, namely (i) security officers and the police and (ii) armed service personnel. Hence, there is an underpinning assumption that good governance practices embodied within the framework of the forces of law and order helps to lessen the potentially adverse consequences of terrorism. Therefore, the research question which the study aims to answer is: "can the forces of law and order effectively modulate the effect of terrorism externalities on tourist arrivals across the world?"

The closest strand of the literature to the present study has focused on using foreign aid policy to limit the consequences of terrorism on macroeconomic variables (Bandyopadhyay *et al.*, 2014; Asongu & Nwachukwu, 2017). We deviate from this stream of literature by focusing on internal policies and the tourism sector.

2. Data and methodology

The study focuses on a sample of 163 countries using data for the period 2010 to 2015. The data is obtained from a plethora of sources disclosed in Table 1. The choice of geographical and temporal scopes of the study is contingent on data availability constraints. This justification is in accordance with recent literature that has used the same dataset (Asongu, 2018; Asongu & Acha-Anyi, 2018).

The dependent variable is the number of tourist arrivals. The insecurity variables or policy syndromes are captured with four main terrorism externalities, namely the number of:

incidents, injuries, fatalities and property damages. The modulating policy variables are the forces of law and order comprising: (i) security officers and the police and (ii) armed service personnel. The selection of these policy syndromes and policy variables is motivated by the literature on the determinants of violence, crimes, terrorism and tourism (see Freytag *et al.*, 2011; GPI, 2016; Asongu & Kodila-Tedika, 2016, 2017; Asongu *et al.*, 2018). The adopted control variables include: homicide, violent demonstrations and incarcerations¹. These indicators are consistent with the extant studies on tourist arrivals (Saha & Yap, 2013; Alvarez & Campo, 2014; Mehmood *et al.*, 2016). The first-two variables (i.e. homicide and violent demonstrations) are anticipated to negatively influence tourist arrivals while the third (i.e. incarcerations) is expected to positively affect tourism. This is essentially because the first-two increase perceived risk to life in the destination country whereas the third reduces the perceived risk.

Table 1: Definition of variables

Variables	Definitions of variables and sources
Tourism	The number of tourists arrivals
Security Officers & Police	Number of internal security officers and police per 100,000 people UNODC; EIU estimates
Armed Services Personnel	Number of armed services personnel per 100,000 people The Military Balance, IISS
Terrorism incidents	Logarithm (1+ base) of Total number of terrorist incidents in a given year.
Terrorism fatalities	Logarithm (1+ base) of Total number of fatalities caused by terrorists in a given year
Terrorism injuries	Logarithm (1+ base) of Total number of injuries caused by terrorists in a given year
Terrorism-related property damages	Logarithm (1+ base) of the measure of the total property damage from terrorist incidents in a given year.
Homicides	Number of homicides per 100,000 people United Nations Office on Drugs and Crime (UNODC) Surveys on Crime Trends and the Operations of Criminal Justice Systems (CTS); EIU estimates
Incarceration	Number of jailed population per 100,000 people World Prison Brief, International Centre for Prison Studies, University of Essex
Violent demonstrations	Likelihood of violent demonstrations Qualitative assessment by EIU analysts

Uppsala Conflict Data Program (UCDP). The Institute for Economics and Peace (IEP).The Economic Intelligence Unit (EIU). United Nations Peacekeeping Funding (UNPKF). GDP: Gross Domestic Product. The International Institute for Strategic Studies (IISS).

Table 1 provides the definitions and sources of variables. We note that the summary statistics of the selected variables indicate that standard deviation of the dependent variable is much higher than the mean. Such evidence of over-dispersion of data on the outcome variable

¹ By incarcerations, the study refers to all types of lawful convictions (i.e. those related to terrorist activity as well as those related to drug, petty thefts, *inter alia*).

suggests that a Negative Binomial model is a more appropriate estimation technique. Consistent with Choi and Luo (2013) and Choi (2015), a Negative Binomial regression is used because the data is positively skewed. Moreover, in line with recent literature, the independent variables are lagged by one year in order to correct for potential endogeneity (Mlachila *et al.*, 2017). Owing to lack of space, the summary statistics, correlation matrix and model specification are available upon request.

3. Empirical results

This section presents and discusses the empirical findings. Whereas Table 2 shows findings pertaining to security officers and the police, those in Table 3 relate to armed service personnel.

Table 2: Negative binomial regressions with security officers and police

Alpha	1.853***	1.962***	1.932***	1.887***	1.361***	1.456***	1.429***	1.389***
Observations	580	580	580	580	580	580	580	580

***, **, *: significance levels at 1%, 5% and 10% respectively. Mean value of Security Officers & Police: 2.728. Min and Maximum values of Security Officers & Police are respectively 1.081 and 5.000. na: not applicable due to the insignificance of unconditional effects of insecurity variables and/or conditional effect from the interaction between the security policy variable and insecurity variables.

In both tables, the first panel is concerned with estimations that do not involve controls variables, while the second panel includes a conditioning information set. In order to examine the importance of forces of law and order in reducing the potential adverse impact of terrorism externalities on tourism, corresponding net effects are computed in conformity with arguments in recent literature (Tchamyou, 2018).

Net effects	0.314	na	0.149	0.344	0.308	na	na	na
Log likelihood	-9565.688	-9593.480	-9584.007	-9573.867	-9443.793	-9470.558	-9462.457	-9451.469
Likelihood Ratio (LR) Chi-Square	62.32***	6.74*	25.68***	45.96***	306.11***	252.58***	268.78***	290.76***
Alpha	1.837***	1.962***	1.919***	1.873***	1.362***	1.456***	1.427***	1.388***
Observations	580	580	580	580	580	580	580	580

***, **, *: significance levels at 1%, 5% and 10% respectively. Armed S. Personnel: Armed Service Personnel. Mean value of Armed Service Personnel: 1.648. Min and Maximum values of Armed Service Personnel are respectively 1.000 and 5.000. na: not applicable due to the insignificance of unconditional effects of insecurity variables and/or conditional effect from the interaction between the security policy variable and insecurity variables.

Given the above emphasis, in the second column of Table 3, the net effect from the role of armed service personnel in modulating the possible adverse effects of terrorism incidences is 0.314 ($[-0.209 \times 1.648] + [0.659]$), where: 0.659 is the unconditional effect from terrorist events; 1.648 is the mean value of armed service personnel and -0.209 is the conditional effect from the interaction between terrorist attacks and armed service personnel. It is important to note that the effects (unconditional and conditional) should be interpreted from a holistic

perspective in order to comprehensively assess the role of armed service personnel in controlling the possible damaging effects of terrorist incidences on tourist arrivals.

In the light of above computational insights, in Table 2, we may infer that security officers and police do not significantly affect terrorism outcomes in their relationship with tourist arrivals. This is presumably because net effects are not applicable due to consistently insignificant conditional and unconditional effects. Conversely, in Table 3 pertaining to armed service personnel, positive net effects are largely apparent in the relationship between tourist arrivals and three out of our four selected terrorism externalities, notably the number of: incidents, injuries and property damages. Net effects cannot be computed for the interconnections with terrorism fatalities for the same reason as in Table 2.

The significant control variables have the expected signs. Accordingly, in both tables, violent demonstrations and homicides have a negative effect on tourist arrivals while the number of incarcerations displays the opposite effect.

4. Concluding implications and future research directions

In this paper, we investigated the role of security officers, the police and armed service personnel in dampening the effect of terrorism externalities on tourist arrivals. From the findings it is obvious that the fight against the possible destructive influence of terrorist attacks on development outcomes is beyond the scope of internal security officers and the police. In other words, security officers and the police by themselves are necessary but not sufficient to mitigate the adverse consequences of terrorism. It is important to note that the police and security officers within the context of the study represent personnel in public agencies whose principal functions are the prevention, detection and investigation of crime and the apprehension of alleged offenders. Conversely, armed service personnel entail all service men and women on full-time duty in the army, navy, air force and joint forces (including conscripts and long-term assignments from the reserves). Thus, our results effectively capture the relevance of a military dimension in the fight against terrorism. To this end, assessing how military expenditure influences the harmful development externalities of terrorism is a worthwhile future research direction.
